Programmable Controller

Transition from MELSEC-A/QnA (Large Type)
Series to MELSEC iQ-R Series Handbook

## SAFETY PRECAUTIONS

(Read these precautions before using this product.)
Before using MELSEC iQ-R series programmable controllers, please read the manuals for the product and the relevant manuals introduced in those manuals carefully, and pay full attention to safety to handle the product correctly.
In this manual, the safety precautions are classified into two levels: " $\lfloor$ WARNING" and " ! CAUTION".

## . WARNING

Indicates that incorrect handling may cause hazardous conditions, resulting in death or severe injury.

## $\triangle$ CAUTION

Indicates that incorrect handling may cause hazardous conditions, resulting in minor or moderate injury or property damage.
Under some circumstances, failure to observe the precautions given under " consequences.
Observe the precautions of both levels because they are important for personal and system safety.
Make sure that the end users read this manual and then keep the manual in a safe place for future reference.

## [Design Precautions]

## WARNING

- Configure safety circuits external to the programmable controller to ensure that the entire system operates safely even when a fault occurs in the external power supply or the programmable controller. Failure to do so may result in an accident due to an incorrect output or malfunction.
(1) Emergency stop circuits, protection circuits, and protective interlock circuits for conflicting operations (such as forward/reverse rotations or upper/lower limit positioning) must be configured external to the programmable controller.
(2) When the programmable controller detects an abnormal condition, it stops the operation and all outputs are:
- Turned off if the overcurrent or overvoltage protection of the power supply module is activated.
- Held or turned off according to the parameter setting if the self-diagnostic function of the CPU module detects an error such as a watchdog timer error.
(3) All outputs may be turned on if an error occurs in a part, such as an I/O control part, where the CPU module cannot detect any error. To ensure safety operation in such a case, provide a safety mechanism or a fail-safe circuit external to the programmable controller.
(4) Outputs may remain on or off due to a failure of a component such as a relay and transistor in an output circuit. Configure an external circuit for monitoring output signals that could cause a serious accident.
- In an output circuit, when a load current exceeding the rated current or an overcurrent caused by a load short-circuit flows for a long time, it may cause smoke and fire. To prevent this, configure an external safety circuit, such as a fuse.
- Configure a circuit so that the programmable controller is turned on first and then the external power supply. If the external power supply is turned on first, an accident may occur due to an incorrect output or malfunction.
- For the operating status of each station after a communication failure, refer to manuals relevant to the network. Incorrect output or malfunction due to a communication failure may result in an accident.
- When connecting an external device with a CPU module or intelligent function module to modify data of a running programmable controller, configure an interlock circuit in the program to ensure that the entire system will always operate safely. For other forms of control (such as program modification, parameter change, forced output, or operating status change) of a running programmable controller, read the relevant manuals carefully and ensure that the operation is safe before proceeding. Improper operation may damage machines or cause accidents.

## [Design Precautions]

## WARNING

- Especially, when a remote programmable controller is controlled by an external device, immediate action cannot be taken if a problem occurs in the programmable controller due to a communication failure. To prevent this, configure an interlock circuit in the program, and determine corrective actions to be taken between the external device and CPU module in case of a communication failure.
- Do not write any data to the "system area" and "write-protect area" of the buffer memory in the module. Also, do not use any "use prohibited" signals as an output signal from the CPU module to each module. Doing so may cause malfunction of the programmable controller system. For the "system area", "write-protect area", and the "use prohibited" signals, refer to the user's manual for the module used.
- If a communication cable is disconnected, the network may be unstable, resulting in a communication failure of multiple stations. Configure an interlock circuit in the program to ensure that the entire system will always operate safely even if communications fail. Incorrect output or malfunction due to a communication failure may result in an accident.
- To maintain the safety of the programmable controller system against unauthorized access from external devices via the network, take appropriate measures. To maintain the safety against unauthorized access via the Internet, take measures such as installing a firewall.
[Precautions for using digital-analog converter modules]
- Analog outputs may remain on due to a failure of the module. Configure an external interlock circuit for output signals that could cause a serious accident.
[Precautions for using high-speed counter modules]
- Outputs may remain on or off due to a failure of a transistor for external output. Configure an external circuit for monitoring output signals that could cause a serious accident.
[Precautions for using positioning modules]
- Configure safety circuits external to the programmable controller to ensure that the entire system operates safely even when a fault occurs in the external power supply or the programmable controller. Failure to do so may result in an accident due to an incorrect output or malfunction.
(1) Machine OPR (Original Point Return) is controlled by two kinds of data: an OPR direction and an OPR speed. Deceleration starts when the near-point dog signal turns on. If an incorrect OPR direction is set, motion control may continue without deceleration. To prevent machine damage caused by this, configure an interlock circuit external to the programmable controller.
(2) When the positioning module detects an error, the motion slows down and stops or the motion suddenly stops, depending on the stop group setting in parameter. Set the parameters to meet the specifications of the positioning control system used. In addition, set the OPR parameters and positioning data within the specified setting range.
(3) Outputs may remain on or off, or become undefined due to a failure of a component such as an insulation element and transistor in an output circuit, where the positioning module cannot detect any error. In a system where the incorrect outputs could cause a serious accident, configure an external circuit for monitoring output signals.
- An absolute position restoration by the positioning module may turn off the servo-on signal (servo off) for approximately $60 \mathrm{~ms}+$ scan time, and the motor may run unexpectedly. If this causes a problem, provide an electromagnetic brake to lock the motor during absolute position restoration.

## [Design Precautions]

## WARNING

## [Precautions for using CC-Link system master/local modules]

- To set a refresh device in the module parameters, select the device Y for the remote output (RY) refresh device. If a device other than Y , such as M and L , is selected, the CPU module holds the device status even after its status is changed to STOP. For how to stop data link, refer to the MELSEC iQ-R CC-Link System Master/Local Module User's Manual (Application).
[Precautions for using products in a Class I, Division 2 environment]
- Products with the CI.I, DIV. 2 mark on the rating plate are suitable for use in Class I, Division 2, Groups A, B, C and D hazardous locations, or nonhazardous locations only.
This mark indicates that the product is certified for use in the Class I, Division 2 environment where flammable gases, vapors, or liquids exist under abnormal conditions. When using the products in the Class I, Division 2 environment, observe the following to reduce the risk of explosion.
- This device is open-type and is to be installed in an enclosure suitable for the environment and require a tool or key to open.
- Warning - Explosion Hazard - Substitution of any component may impair suitability for Class I, Division 2.
- Warning - Explosion Hazard - Do not disconnect equipment while the circuit is live or unless the area is known to be free of ignitable concentrations.
- Do not open the cover of the CPU module and remove the battery unless the area is known to be nonhazardous.
- All MELSEC iQ-R modules (except base modules) are to be connected to a base module only.

## [Design Precautions]

## $\triangle$ CAUTION <br> - Do not install the control lines or communication cables together with the main circuit lines or power cables. Keep a distance of 100 mm or more between them. Failure to do so may result in malfunction due to noise. <br> - During control of an inductive load such as a lamp, heater, or solenoid valve, a large current (approximately ten times greater than normal) may flow when the output is turned from off to on. Therefore, use a module that has a sufficient current rating. <br> - After the CPU module is powered on or is reset, the time taken to enter the RUN status varies depending on the system configuration, parameter settings, and/or program size. Design circuits so that the entire system will always operate safely, regardless of the time. <br> - Do not power off the programmable controller or reset the CPU module while the settings are being written. Doing so will make the data in the flash ROM and SD memory card undefined. The values need to be set in the buffer memory and written to the flash ROM and SD memory card again. Doing so also may cause malfunction or failure of the module. <br> - When changing the operating status of the CPU module from external devices (such as the remote RUN/STOP functions), select "Do Not Open by Program" for "Opening Method" of "Module Parameter". If "Open by Program" is selected, an execution of the remote STOP function causes the communication line to close. Consequently, the CPU module cannot reopen the line, and external devices cannot execute the remote RUN function.

## [Design Precautions]

## CAUTION

[Precautions for using digital-analog converter modules]

- Power on or off the external power supply while the programmable controller is on. Failure to do so may result in incorrect output or malfunction.
- At on/off of the power or external power supply, or at the output range switching, a voltage may occur or a current may flow between output terminals for a moment. In this case, start the control after analog outputs become stable.

## [Precautions for using high-speed counter modules]

- Do not install the control lines or communication cables together with the main circuit lines or power cables. Keep a distance of 150 mm or more between them. Failure to do so may result in malfunction due to noise.

## [Installation Precautions]

## WARNING

Shut off the external power supply (all phases) used in the system before mounting or removing the module. Failure to do so may result in electric shock or cause the module to fail or malfunction.

## [Installation Precautions]

## CAUTION

- Use the programmable controller in an environment that meets the general specifications. Failure to do so may result in electric shock, fire, malfunction, or damage to or deterioration of the product.
- To mount a module, place the concave part(s) located at the bottom onto the guide(s) of the base unit, and push in the module until the hook(s) located at the top snaps into place. Incorrect interconnection may cause malfunction, failure, or drop of the module.
- To mount a module with no module fixing hook, place the concave part(s) located at the bottom onto the guide(s) of the base unit, push in the module, and fix it with screw(s). Incorrect interconnection may cause malfunction, failure, or drop of the module.
- When using the programmable controller in an environment of frequent vibrations, fix the module with a screw.
- Tighten the screws within the specified torque range. Undertightening can cause drop of the screw, short circuit, or malfunction. Overtightening can damage the screw and/or module, resulting in drop, short circuit, or malfunction.
- When using an extension cable, connect it to the extension cable connector of the base unit securely. Check the connection for looseness. Poor contact may cause malfunction.
- When using an SD memory card, fully insert it into the SD memory card slot. Check that it is inserted completely. Poor contact may cause malfunction.
- Securely insert an extended SRAM cassette or a battery-less option cassette into the cassette connector of the CPU module. After insertion, close the cassette cover and check that the cassette is inserted completely. Poor contact may cause malfunction.
- Do not directly touch any conductive parts and electronic components of the module, SD memory card, extended SRAM cassette, battery-less option cassette, or connector. Doing so can cause malfunction or failure of the module.

## [Wiring Precautions]

## WARNING

- Shut off the external power supply (all phases) used in the system before installation and wiring. Failure to do so may result in electric shock or cause the module to fail or malfunction.
- After installation and wiring, attach a blank cover module (RG60) to each empty slot and an included extension connector protective cover to the unused extension cable connector before powering on the system for operation. Failure to do so may result in electric shock.

## [Wiring Precautions]

## CAUTION

- Individually ground the FG and LG terminals of the programmable controller with a ground resistance of 100 ohms or less. Failure to do so may result in electric shock or malfunction.
- Use applicable solderless terminals and tighten them within the specified torque range. If any spade solderless terminal is used, it may be disconnected when the terminal screw comes loose, resulting in failure.
- Check the rated voltage and signal layout before wiring to the module, and connect the cables correctly. Connecting a power supply with a different voltage rating or incorrect wiring may cause fire or failure.
- Connectors for external devices must be crimped or pressed with the tool specified by the manufacturer, or must be correctly soldered. Incomplete connections may cause short circuit, fire, or malfunction.
- Securely connect the connector to the module. Poor contact may cause malfunction.
- Do not install the control lines or communication cables together with the main circuit lines or power cables. Keep a distance of 100 mm or more between them. Failure to do so may result in malfunction due to noise.
- Place the cables in a duct or clamp them. If not, dangling cables may swing or inadvertently be pulled, resulting in malfunction or damage to modules or cables.
In addition, the weight of the cables may put stress on modules in an environment of strong vibrations and shocks.
Do not clamp the extension cables with the jacket stripped. Doing so may change the characteristics of the cables, resulting in malfunction.
- Check the interface type and correctly connect the cable. Incorrect wiring (connecting the cable to an incorrect interface) may cause failure of the module and external device.
- Tighten the terminal screws or connector screws within the specified torque range. Undertightening can cause drop of the screw, short circuit, fire, or malfunction. Overtightening can damage the screw and/or module, resulting in drop, short circuit, fire, or malfunction.
- When disconnecting the cable from the module, do not pull the cable by the cable part. For the cable with connector, hold the connector part of the cable. For the cable connected to the terminal block, loosen the terminal screw. Pulling the cable connected to the module may result in malfunction or damage to the module or cable.
- Prevent foreign matter such as dust or wire chips from entering the module. Such foreign matter can cause a fire, failure, or malfunction.
- A protective film is attached to the top of the module to prevent foreign matter, such as wire chips, from entering the module during wiring. Do not remove the film during wiring. Remove it for heat dissipation before system operation.

## [Wiring Precautions]

## CAUTION

- Programmable controllers must be installed in control panels. Connect the main power supply to the power supply module in the control panel through a relay terminal block. Wiring and replacement of a power supply module must be performed by qualified maintenance personnel with knowledge of protection against electric shock.
- For Ethernet cables to be used in the system, select the ones that meet the specifications in the user's manual for the module used. If not, normal data transmission is not guaranteed.
[Precautions for using channel isolated RTD input modules]
- Individually ground the shielded cables of the programmable controller with a ground resistance of 100 ohms or less. Failure to do so may result in electric shock or malfunction.
[Precautions for using channel isolated thermocouple input modules]
- Individually ground the shielded cables of the programmable controller with a ground resistance of 100 ohms or less. Failure to do so may result in electric shock or malfunction.
- Do not place the module near a device that generates magnetic noise.
[Precautions for using high-speed counter modules]
- Do not install the control lines or communication cables together with the main circuit lines or power cables. Keep a distance of 150 mm or more between them. Failure to do so may result in malfunction due to noise.
- Ground the shielded cables on the encoder side (relay box) with a ground resistance of 100 ohm or less. Failure to do so may cause malfunction.
[Precautions for using CC-Link system master/local modules]
- Use Ver.1.10-compatible CC-Link dedicated cables in a CC-Link system. If not, the performance of the CC-Link system is not guaranteed. For the station-to-station cable length and the maximum overall cable length, follow the specifications in the MELSEC iQ-R CC-Link System Master/Local Module User's Manual (Startup). If not, normal data transmission is not guaranteed.

## [Startup and Maintenance Precautions]

## WARNING

- Do not touch any terminal while power is on. Doing so will cause electric shock or malfunction.
- Correctly connect the battery connector. Do not charge, disassemble, heat, short-circuit, solder, or throw the battery into the fire. Also, do not expose it to liquid or strong shock. Doing so will cause the battery to produce heat, explode, ignite, or leak, resulting in injury and fire.
- Shut off the external power supply (all phases) used in the system before cleaning the module or retightening the terminal screws, connector screws, or module fixing screws. Failure to do so may result in electric shock.

## [Startup and Maintenance Precautions]

## CAUTION

- When connecting an external device with a CPU module or intelligent function module to modify data of a running programmable controller, configure an interlock circuit in the program to ensure that the entire system will always operate safely. For other forms of control (such as program modification, parameter change, forced output, or operating status change) of a running programmable controller, read the relevant manuals carefully and ensure that the operation is safe before proceeding. Improper operation may damage machines or cause accidents.
- Especially, when a remote programmable controller is controlled by an external device, immediate action cannot be taken if a problem occurs in the programmable controller due to a communication failure. To prevent this, configure an interlock circuit in the program, and determine corrective actions to be taken between the external device and CPU module in case of a communication failure.
- Do not disassemble or modify the modules. Doing so may cause failure, malfunction, injury, or a fire.
- Use any radio communication device such as a cellular phone or PHS (Personal Handy-phone System) more than 25 cm away in all directions from the programmable controller. Failure to do so may cause malfunction.
- Shut off the external power supply (all phases) used in the system before mounting or removing the module. Failure to do so may cause the module to fail or malfunction.
- Tighten the screws within the specified torque range. Undertightening can cause drop of the component or wire, short circuit, or malfunction. Overtightening can damage the screw and/or module, resulting in drop, short circuit, or malfunction.
- After the first use of the product, do not perform each of the following operations more than 50 times (IEC 61131-2/JIS B 3502 compliant).
Exceeding the limit may cause malfunction.
- Mounting/removing the module to/from the base unit
- Inserting/removing the extended SRAM cassette or battery-less option cassette to/from the CPU module
- Mounting/removing the terminal block to/from the module
- After the first use of the product, do not insert/remove the SD memory card to/from the CPU module more than 500 times. Exceeding the limit may cause malfunction.
- Do not touch the metal terminals on the back side of the SD memory card. Doing so may cause malfunction or failure of the module.
- Do not touch the integrated circuits on the circuit board of an extended SRAM cassette or a batteryless option cassette. Doing so may cause malfunction or failure of the module.
- Do not drop or apply shock to the battery to be installed in the module. Doing so may damage the battery, causing the battery fluid to leak inside the battery. If the battery is dropped or any shock is applied to it, dispose of it without using.
- Startup and maintenance of a control panel must be performed by qualified maintenance personnel with knowledge of protection against electric shock. Lock the control panel so that only qualified maintenance personnel can operate it.
- Before handling the module, touch a conducting object such as a grounded metal to discharge the static electricity from the human body. Failure to do so may cause the module to fail or malfunction.

## [Operating Precautions]

## CAUTION

- When changing data and operating status, and modifying program of the running programmable controller from an external device such as a personal computer connected to an intelligent function module, read relevant manuals carefully and ensure the safety before operation. Incorrect change or modification may cause system malfunction, damage to the machines, or accidents.
- Do not power off the programmable controller or reset the CPU module while the setting values in the buffer memory are being written to the flash ROM in the module. Doing so will make the data in the flash ROM and SD memory card undefined. The values need to be set in the buffer memory and written to the flash ROM and SD memory card again. Doing so can cause malfunction or failure of the module.
[Precautions for using positioning modules]
- Note that when the reference axis speed is specified for interpolation operation, the speed of the partner axis (2nd, 3rd, or 4th axis) may exceed the speed limit value.
- Do not go near the machine during test operations or during operations such as teaching. Doing so may lead to injuries.

## [Disposal Precautions]

## CAUTION

- When disposing of this product, treat it as industrial waste.
- When disposing of batteries, separate them from other wastes according to the local regulations.

## [Transportation Precautions]

## CAUTION

- When transporting lithium batteries, follow the transportation regulations.
- The halogens (such as fluorine, chlorine, bromine, and iodine), which are contained in a fumigant used for disinfection and pest control of wood packaging materials, may cause failure of the product. Prevent the entry of fumigant residues into the product or consider other methods (such as heat treatment) instead of fumigation. The disinfection and pest control measures must be applied to unprocessed raw wood.

## CONDITIONS OF USE FOR THE PRODUCT

(1) Mitsubishi programmable controller ("the PRODUCT") shall be used in conditions;
i) where any problem, fault or failure occurring in the PRODUCT, if any, shall not lead to any major or serious accident; and
ii) where the backup and fail-safe function are systematically or automatically provided outside of the PRODUCT for the case of any problem, fault or failure occurring in the PRODUCT.
(2) The PRODUCT has been designed and manufactured for the purpose of being used in general industries.

MITSUBISHI SHALL HAVE NO RESPONSIBILITY OR LIABILITY (INCLUDING, BUT NOT LIMITED TO ANY AND ALL RESPONSIBILITY OR LIABILITY BASED ON CONTRACT, WARRANTY, TORT, PRODUCT LIABILITY) FOR ANY INJURY OR DEATH TO PERSONS OR LOSS OR DAMAGE TO PROPERTY CAUSED BY the PRODUCT THAT ARE OPERATED OR USED IN APPLICATION NOT INTENDED OR EXCLUDED BY INSTRUCTIONS, PRECAUTIONS, OR WARNING CONTAINED IN MITSUBISHI'S USER, INSTRUCTION AND/OR SAFETY MANUALS, TECHNICAL
BULLETINS AND GUIDELINES FOR the PRODUCT.
("Prohibited Application")
Prohibited Applications include, but not limited to, the use of the PRODUCT in;

- Nuclear Power Plants and any other power plants operated by Power companies, and/or any other cases in which the public could be affected if any problem or fault occurs in the PRODUCT.
- Railway companies or Public service purposes, and/or any other cases in which establishment of a special quality assurance system is required by the Purchaser or End User.
- Aircraft or Aerospace, Medical applications, Train equipment, transport equipment such as Elevator and Escalator, Incineration and Fuel devices, Vehicles, Manned transportation, Equipment for Recreation and Amusement, and Safety devices, handling of Nuclear or Hazardous Materials or Chemicals, Mining and Drilling, and/or other applications where there is a significant risk of injury to the public or property.
Notwithstanding the above restrictions, Mitsubishi may in its sole discretion, authorize use of the PRODUCT in one or more of the Prohibited Applications, provided that the usage of the PRODUCT is limited only for the specific applications agreed to by Mitsubishi and provided further that no special quality assurance or fail-safe, redundant or other safety features which exceed the general specifications of the PRODUCTs are required. For details, please contact the Mitsubishi representative in your region.

## INTRODUCTION

Thank you for purchasing the Mitsubishi Electric MELSEC iQ-R series programmable controllers.
This document describes the system configuration, specifications, installation, wiring, maintenance, and inspection of MELSEC iQ-R series programmable controllers.
Before using this product, please read this document and the relevant manuals carefully and develop familiarity with the functions and performance of the MELSEC iQ-R series programmable controller to handle the product correctly.
When applying the program and circuit examples provided in this document to an actual system, ensure the applicability and confirm that it will not cause system control problems.
Please make sure that the end users read this document.
Specifications are subject to change without notice.

## generic TERMS USED IN THIS DOCUMENT

| Generic term | Description |
| :--- | :--- |
| ACPU | A generic term for the MELSEC-A series CPU modules |
| AnACPU | A generic term for the A2ACPU(-S1), A3ACPU, A2ACPUP21/R21, A2ACPUP21/R21-S1, and A3ACPUP21/ <br> R21 |
| AnNCPU | A generic term for the A1NCPU, A1NCPUP21/R21, A1NCPUP21-S3, A2NCPU(-S1), A2NCPUP21/R21, <br> A2NCPUP21/R21-S1, A2NCPUP21-S3/S4, A3NCPU, A3NCPUP21/R21, and A3NCPUP21-S3 |
| AnUCPU | A generic term for the A2UCPU(-S1), A3UCPU, and A4UCPU |
| QnACPU | A generic term for the MELSEC-QnA series CPU modules |
| RCPU | A generic term for the MELSEC iQ-R series CPU modules |
| RnCPU | A generic term for the R00CPU, R01CPU, R02CPU, R04CPU, R08CPU, R16CPU, R32CPU, and R120CPU |

### 1.1 Considerations Before Selecting Alternative Models for Replacement

Some items need to be considered before replacing modules from the MELSEC-A/QnA series to the MELSEC iQ-R series. The following are main items to be considered. Consider them sufficiently in advance.
(It is necessary to understand the existing system configuration before taking the items into consideration.)

## Replacement methods and installation location

Whether some space can be reserved when adding a base unit at the replacement work.

## Model selection (I/O module)

Whether a module whose specifications (rated input current and others) and functions are equivalent to that of the existing module exists or not in the MELSEC iQ-R series.
Whether using the existing external wiring or wiring newly.

## Model selection (intelligent function module)

Whether the specifications of the replaced module and connection external device match or not.
Whether using the existing external wiring or wiring newly.

## Model selection (control network module)

Whether MELSECNET can be replaced with CC-Link IE Control or CC-Link IE Field.
Whether a new communication cable installation has been considered or not at the replacement of the network.

## Model selection (communication module)

Whether the communication target device is compatible with the MELSEC $i Q-R$ series module commands in the communications using the MC protocol or not.
Whether the software (program) of the communication target device can be converted into the one supported by the MELSEC iQ-R series.

## Use of existing programs

[^0]
### 1.2 Overview of the MELSEC $\operatorname{iQ}-\mathrm{R}$ Series

MELSEC iQ-R series modules equipped with the newly developed high-speed system bus significantly reduces the takt time. And with its high-accuracy motion control achieved by the multiple CPU high-speed transmission, the MELSEC iQ-R series is at the core of automation systems, helping to provide solutions to customers.

## Revolutionary, next-generation controllers building a new era in automation

To succeed in highly competitive markets, it's important to build automation systems that ensure high productivity and consistent product quality.

The MELSEC iQ-R Series has been developed from the ground up based on common problems faced by customers and rationalizing them into seven key areas: Productivity, Engineering, Maintenance, Quality, Connectivity, Security and Compatibility. Mitsubishi Electric is taking a three-point approach to solving these problems: Reducing TCO*1, increasing Reliability and Reusability of existing assets.
*1 Total Cost of Ownership

## Process: High availability process control in a scalable automation solution

- Extensive visualization and data acquisition
- High availability across multiple levels
- Integrated process control software simplifies engineering

## Safety: System design flexibility with integrated safety control

- Integrated generic and safety control
- Consolidated network topology
- Complies with international safety standards

## Intelligence: Extensive data handling from shop floor to business process systems

- Direct data collection and analysis
- C/C++ based programming
- Collect factory data in real-time
- Expand features using third party partner applications

## Productivity: Improve productivity through advanced performance/functionality

- New high-speed system bus realizing shorter production cycle
- Super-high-accuracy motion control utilizing advanced multiple CPU features
- Inter-modular synchronization resulting in increased processing accuracy

## Engineering: Reducing development costs through intuitive engineering

- Intuitive engineering environment covering the product development cycle
- Simple point-and-click programming architecture
- Understanding globalization by multiple language support

## Maintenance: Reduce maintenance costs/downtime with easier maintenance features

[^1]
## Quality: Reliable and trusted MELSEC product quality

- Robust design ideal for harsh industrial environments
- Improve and maintain actual manufacturing quality
- Conforms to main international standards

## Connectivity: Seamless network reduces system costs

- Seamless connectivity within all levels of manufacturing
- High-speed and large data bandwidth ideal for large-scale control systems
- Easy connection of third-party components utilizing device library

## Security: Robust security that can be relied on

- Protect intellectual property
- Unauthorized access protection across distributed control network

## Compatibility: Extensive compatibility with existing products

- Utilize existing assets while taking advantage of cutting-edge technology
- Compatible with most existing MELSEC-Q series modules

### 1.3 How to Replace the System from the MELSEC-A/ QnA Series to the MELSEC iQ-R Series

This section describes how to replace the system from the MELSEC-A/QnA series to the MELSEC iQ-R series.

## Model selection

Select a model to be replaced. For details, refer to the following.
F Page 19 CPU MODULE REPLACEMENT to Page 268 CONTROL NETWORK MODULE REPLACEMENT

## Project conversion

Convert the project used in the MELSEC-A/QnA series so that it can be used in the MELSEC iQ-R series. For details, refer to the following.
W Page 296 PROJECT REPLACEMENT

### 2.1 Alternative Model List

This section lists alternative models of the MELSEC iQ-R series CPU modules in accordance with the program capacity, number of I/O points, and functions of the MELSEC-A/QnA series CPU modules.
Select models that best suit your application considering the scope of control of the MELSEC-A/QnA series CPU module currently used, as well as the system specifications and extensibility after replacement.

*1 The relay symbol language is equivalent to the ladder diagram (LD).
*2 The RnCPU does not support the microcomputer program. Consider replacing it with other programs such as the sequence program.
*3 The number of device points to use can be changed with the engineering tool.
*4 The maximum value is $[\alpha+\beta]$.
$\alpha$ : <Capacity of the R**CPU> (R04CPU: 160K words, R08CPU: 544K words, R16CPU: 800K words)
$\beta$ : Capacity of the extended SRAM cassette
The value must be in the following range.
File register file storage area $\leq[\alpha+\beta]$
*5 This device is converted to the special register area of SD718 or SD719 automatically when the project is converted.
*6 The device " V " is used as the edge relay in the RnCPU.
*7 The special relay areas of M9000 or later are replaced with those of SM, and the special register areas of D9000 or later are replaced with those of SD in the RnCPU.

### 2.3 Function Comparison Table

O: Compatible/function available, $\triangle$ : Partly changed, $\times$ : Incompatible/function not available, 一: Not applicable

| Function |  | MELSEC-A/QnA series |  | MELSEC iQ-R series | Precautions |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | ACPU | QnACPU | RnCPU |  |
| Constant scan | Executes the sequence program at constant time intervals regardless of the processing time of the program. | $\bigcirc$ | $\bigcirc$ | $\triangle$ | Set this function with the special register (D9020) for the ACPU/QnACPU, and with parameters for the RnCPU. |
| Latch (data retention during power failure) | Holds the data of devices in the event of power OFF, resetting, and a momentary power failure longer than the allowable momentary power failure period. | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |
| Remote RUN/STOP | Executes the remote RUN/STOP using external switches and peripheral devices. | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |
| PAUSE | Stops operations while holding the output status. | $\bigcirc$ | $\bigcirc$ | $\triangle$ | The RnCPU transitions to the PAUSE state by turning on the PAUSE contact only, while the ACPU/QnACPU transitions to the PAUSE state by turning on both the PAUSE contact and the special relay M9040. |
| Interrupt processing | Executes the program that corresponds to the cause when an interrupt cause occurs. | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |
| Microcomputer mode | Executes various controls and operations over utility programs and user created microcomputer programs stored in the microcomputer program area by calling them from the sequence program. | AnNCPU: AnA/AnUCPU: $\times$ | $\times$ | $\times$ | The RnCPU does not support the microcomputer program. Consider replacing it with a sequence program. |
| ERROR LED display priority ranking | Sets for ON/OFF of ERROR LED at the occurrence of error. | AnNCPU: $\times$ AnA/AnUCPU: | $\bigcirc$ | $\bigcirc$ |  |
| File management | Manages all data such as parameters, sequence programs, device comments, file registers, as files. | $\times$ | $\bigcirc$ | $\bigcirc$ | Memory configuration and data to be stored differ. |
| Structured program | Selects a suitable execution type for program application, and divides each program by designer, process or others. | $\times$ | $\bigcirc$ | $\bigcirc$ |  |
| I/O assignment | Performs the I/O assignment to any individual module regardless of its mounted position. | $\times$ | $\bigcirc$ | $\bigcirc$ |  |
| ROM operation | Enables operation with parameters and programs stored in ROMs in order not to lose user programs due to battery exhaustion. | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | With the RnCPU, the ROM operation is not required since the program memory is the flash ROM. |
| Data protection function (system protect, keyword registration/ password registration) | Prohibits reading/writing from peripheral devices to programs and comments in the memory cassettes, the memory card, and built-in memory of a CPU module. | $\bigcirc$ | $\bigcirc$ | $\triangle$ | Programs can be protected from read/write using passwords in the RnCPU, while parameters/programs in the user memory can be protected from read/write using keywords in the ACPU/ QnACPU. |
| Initial device value | Sets an initial value of device memory, file registers, and special function modules when the CPU module is placed in RUN status. | $\times$ | $\bigcirc$ | $\bigcirc$ | Memory configuration and data to be stored differ. |

| Function |  | MELSEC-A/QnA series |  | MELSEC iQ-R series RnCPU | Precautions |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | ACPU | QnACPU |  |  |
| Output status setting at changing from STOP to RUN | Sets the output (Y) status at the change from STOP to RUN to reoutputting data before STOP or outputting data after the operation execution. | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |
| Number of general data processing | Sets the number of general data processing executed in one END operation. | $\times$ | $\bigcirc$ | $\bigcirc$ |  |
| Clock function | The CPU module incorporates a clock, which can be read/written. The clock data consists of year, month, day, hour, minute, second and a day of the week. | $\bigcirc$ | $\bigcirc$ | $\triangle$ | The RnCPU uses 4-digit year of the western calendar while the ACPU/QnACPU uses the lower 2-digit year. |
| Write during RUN | Changes (writes to) programs when the CPU module is in the RUN status. | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | Setting the reserved area for online change is required for the RnCPU. |
| Status latch | Stores the data of all devices in a memory cassette or a memory card at the occurrence of an error for monitoring by a peripheral. | (except for the A1NCPU) | O*1 | $\times$ | The status latch function cannot be used in the RnCPU. |
| Sampling trace | Stores the data of specified devices in a memory cassette or a memory card at the specified intervals for monitoring by a peripheral. | (except for the A1NCPU) | $\bigcirc$ | $\times$ | The sampling trace function cannot be used in the RnCPU. Use the trigger logging in the data logging function instead. |
| Program trace | Collects the execution status of specified programs and steps, and stores them in a file. | $\times$ | $\bigcirc{ }^{* 1}$ | $\times$ | The program trace function cannot be used in the RnCPU. |
| Simulation function | Detaches I/O modules or special modules from the CPU module and test-operates the program upon the step operation. | $\times$ | $\bigcirc{ }^{* 1}$ | $\triangle$ | Use the simulation function of the GX Works3 instead. |
| Step operation | Stops the execution of a sequence program at the specified step. | $\bigcirc$ | $\bigcirc$ | $\times$ | The step operation function cannot be used in the RnCPU. |
| Execution time measurement (Program list monitor, scan time measurement) | Measures the operation time for each program. | $\times$ | $\bigcirc$ | $\bigcirc$ |  |
| Module access interval reading | Monitors the access interval of special function modules or peripheral devices. | $\times$ | $\bigcirc$ | $\bigcirc$ |  |
| Off-line switch | Skips the devices used for OUT instruction in the operation processing of sequence program. | AnNCPU: $\bigcirc$ AnA/AnUCPU: $\times$ | $\times$ | $\times$ | The off-line switch function cannot be used in the RnCPU. Use the external input/output forced on/off function of the RnCPU instead. |
| Online I/O module replacement | Enables I/O modules to be replaced while the CPU is in RUN. | $\bigcirc$ | $\bigcirc$ | $\triangle$ | To use the online module change function of the RnCPU, use the Process CPU |
| Self-diagnostics | Diagnoses whether any error has occurred, detects errors, and stops the CPU module, etc. | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | Error codes differ from the ones of ACPU and QnACPU. |
| Error history | Stores errors detected by the diagnostics function into the CPU module. Error details can be monitored from peripherals. | AnNCPU: $\times$ <br> AnA/AnUCPU: | $\bigcirc$ | $\bigcirc$ |  |

### 2.4 Precautions for Replacement

## Memory configuration

The Memory configuration differs between the MELSEC-A/QnA series CPU module and the MELSEC iQ-R series CPU module. Depending on the capacity and application of the memory before replacement, consider which memory to use and whether to use a memory card.

MELSEC-QnA series

MELSEC iQ-R series

*1 The R00CPU, R01CPU, and R02CPU do not support the extended SRAM cassette.
*2 The R00CPU does not support SD memory cards.

## Write during RUN

Before executing the online change function (the write during RUN function) in the MELSEC iQ-R series CPU module, reserve the area in advance for the program size that will be increased.
The default reserved area for online change is 500 steps (2000 bytes).

## Parameters

Set parameters, such as the program setting, that are specific to each CPU module in the CPU parameter. In addition, set the module parameter to use the built-in Ethernet function of the CPU module, and set the memory card parameter to perform boot operation.

## Sampling trace

The sampling trace function cannot be used in the RCPU.
Use the trigger logging of the data logging function instead. Note that an SD memory card is required to store the data because the CPU built-in memory cannot be used as data storage destination.

## Password and keyword

In the RCPU, passwords are used to protect data such as programs from read/write, while in the ACPU/QnACPU, keywords are used.

### 3.1 Alternative Model List

This section lists alternative models of the MELSEC iQ-R series I/O modules in accordance with the specifications of the MELSEC-A/QnA series I/O modules.
Select models that best suit your application considering the specifications of the MELSEC-A/QnA series I/O module currently used.

| ON to OFF (MAX.) | 0.41 ms | 0.5 ms | 0.6 ms | 0.7 ms | 1 ms | 5 ms | 10 ms | 20 ms | 70 ms |

*3 For an upgrade tool, please consult your local Mitsubishi Electric representative.

## Al61-S1 and RX40C7

$\bigcirc$ : Compatible, $\triangle$ : Partly changed, $\times$ : Incompatible, 一: Not applicable

| Item | Specifications |  | Compatibility | Precautions |
| :--- | :--- | :--- | :--- | :--- |
|  | Al61-S1 | RC input (positive common type) | DC input (positive common/negative <br> common shared type) | O |

*1 Check the specifications of sensors and switches connected to the RX40C7.
*2 The following table shows the input response times.

| Timing | Set value |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 0.1 ms | 0.2 ms | 0.4 ms | 0.6 ms | 1 ms | 5 ms | 10 ms | 20 ms | 70 ms |
| OFF to ON (MAX.) | 0.1 ms | 0.2 ms | 0.4 ms | 0.6 ms | 1 ms | 5 ms | 10 ms | 20 ms | 70 ms |
| ON to OFF (MAX.) | 0.35 ms | 0.4 ms | 0.5 ms | 0.7 ms | 1 ms | 5 ms | 10 ms | 20 ms | 70 ms |

*3 For an upgrade tool, please consult your local Mitsubishi Electric representative.

## Blank cover modules

## AG60 and RG60

$\bigcirc$ : Compatible, $\triangle$ : Partly changed, $\times$ : Incompatible, 一: Not applicable

| Item | Specifications |  | Compatibility | Precautions |
| :---: | :---: | :---: | :---: | :---: |
|  | AG60 | RG60 |  |  |
| Number of occupied I/O points | Default: 16 points (Can be changed to $0,16,32,48$, or 64 points by the parameter.) | Default: 16 points (Can be changed to $0,16,32,48$, $64,128,256,512$, or 1024 points by the parameter.) | $\bigcirc$ |  |
| Application | Used as a dustproof cover for a slot not loaded with an I/O module (especially a vacant slot between modules). |  | $\bigcirc$ |  |
| External dimensions | 250 (H) $\times 37.5$ (W) $\times 121$ (D) mm | 106(H) $\times 27.8(\mathrm{~W}) \times 110(\mathrm{D}) \mathrm{mm}$ | - |  |
| Weight | 0.17 kg | 0.07 kg | - |  |

### 3.3 Precautions for Replacement

## Wiring

## Size of cables and solderless terminals

The sizes of wires or solderless terminals that can be used for terminal blocks vary between MELSEC iQ-R series and MELSEC-A/QnA series, since modules and terminal blocks of the MELSEC $\mathrm{i}-\mathrm{R}$ series are smaller than those of the MELSEC-A/QnA series.

When replacing MELSEC-A/QnA series modules with MELSEC iQ-R series modules, use wires and solderless terminals that meet the specifications of MELSEC iQ-R series modules.
The wiring change is not required when the upgrade tool conversion adapter is used for replacement.
(Connection change for power supply and common terminals is required. Also, the conversion adapter fixture is required when the conversion adapter is used.)

As the MELSEC iQ-R series is a smaller model, wiring space on terminal blocks is narrower. Pay much attention in wiring.

## Change from a terminal block to a connecter

A 32-point I/O module of the MELSEC-A/QnA series uses a terminal block while that of MELSEC iQ-R series uses a connecter.

When using a 32-point I/O module of the MELSEC iQ-R series, shift to the wiring using connecters or convert the connecters to terminal blocks with the following methods.

- Using a converter module for a connecter and a terminal block
- Using an upgrade tool conversion adapter

## External wiring connector

An external wiring connecter is not included in packages of 32 - and 64 -point I/O modules of the MELSEC iQ-R series. Purchase the necessary number of the connecters (A6COND) separately.

## Input modules

## Specifications change of rated input current

Check the specifications of external devices (such as sensors and switches) since the rated input current is decreased for some MELSEC iQ-R series input modules compared to that for the MELSEC-A/QnA series.

## Specifications changes of ON voltage/ON current and OFF voltage/OFF current

Check the specifications of external devices (such as sensors and switches) since the ON voltage/ON current and OFF voltage/OFF current differ for some MELSEC iQ-R series input modules compared to that for the MELSEC-A/QnA series.

## Specifications change of rated voltage value

The RX4DCD DC input module of the MELSEC iQ-R series is dedicated to 24VDC. Use the RX7DC4 DC input module at 12VDC.

## Specifications change of response time

For the MELSEC iQ-R series DC input modules, the I/O response time can be set with the parameter. Set the I/O response time that matches the response time of the MELSEC-A/QnA series DC input module.

## Specifications change of common terminal arrangement

The common terminal arrangement may differ between the MELSEC-A/QnA series and MELSEC iQ-R series. Pay attention when applying a different voltage to each common.

## Output modules

## Specifications change of rated output current

Check the specifications of the load side since the rated output current is decreased for some MELSEC iQ-R series output modules compared to that for the MELSEC-A/QnA series.

## Specifications change of common terminal arrangement

The common terminal arrangement may differ between the MELSEC-A/QnA series and MELSEC iQ-R series. Pay attention when applying a different voltage to each common.

## Specifications change of common maximum load current

Since the maximum load current per common may differ between the MELSEC-A/QnA series and MELSEC iQ-R series check them before use.

## Leakage current at OFF

Pay attention that devices that operate with a minute current (such as an LED and a buzzer) connected to the transistor output module may operate due to leakage current at OFF.

## Triac output module

Operation of the triac that is used on a triac output module may be unstable when a sudden change occurs in the voltage and current due to component characteristics.
Problems due to voltage and current fluctuation may become obvious depending on individual differences between components. Refer to the following manual and check relevant items in the precautions.

## Interrupt modules

To use the interrupt function in the MELSEC iQ-R series system, use an input module. Set the interrupt function in the module parameter of the input module used.

For details on these precautions, refer to the following
LDMELSEC iQ-R Module Configuration Manual
L]MELSEC iQ-R I/O Module User's Manual

### 4.1 Alternative Model List

This section lists alternative models of the MELSEC iQ-R series power supply modules in accordance with the specifications of the MELSEC-A/QnA series power supply modules.
Select models that best suit your application considering the specifications of the MELSEC-A/QnA series power supply module currently used.

| Item | MELSEC-A/ QnA series | MELSEC iQ- <br> $\mathbf{R}$ series | Specification difference |

|  | A62PEU | R62P | (1) External wiring: Changed <br> (2) Slots: Not changed <br> (3) Specifications: Rated output voltages (5VDC: $5 \mathrm{~A} \rightarrow 3.5 \mathrm{~A}, 24 \mathrm{VDC}: 0.8 \mathrm{~A} \rightarrow 0.6 \mathrm{~A}$ ), +24 and 24 G terminal screws (M4 screw $\rightarrow$ M3.5 screw), applicable tightening torque (M4 screw: 98 to $137 \mathrm{~N} \cdot \mathrm{~cm} \rightarrow 102$ to $138 \mathrm{~N} \cdot \mathrm{~cm}$ ) <br> (4) Accessories: A spare fuse and a short chip for applied voltage select terminal are not included with the MELSEC iQ-R series power supply module. |
|  | A63P | R63P | (1) External wiring: Changed <br> (2) Slots: Not changed <br> (3) Specifications: Rated output voltage (5VDC: $8 \mathrm{~A} \rightarrow 6.5 \mathrm{~A}$ ), applicable tightening torque (M4 screw: 78 to $118 \mathrm{~N} \cdot \mathrm{~cm} \rightarrow 102$ to $138 \mathrm{~N} \cdot \mathrm{~cm}$ ) <br> (4) Accessories: A spare fuse is not included with the MELSEC iQ-R series power supply module. |
|  | A65P | R62P | (1) External wiring: Changed <br> (2) Slots: Not changed <br> (3) Specifications: Rated output voltages (5VDC: $2 \mathrm{~A} \rightarrow 3.5 \mathrm{~A}, 24 \mathrm{VDC}: 1.5 \mathrm{~A} \rightarrow 0.6 \mathrm{~A}$ ), +24 and 24 G terminal screws (M4 screw $\rightarrow$ M3.5 screw), applicable tightening torque (M4 screw: 78 to $118 \mathrm{~N} \cdot \mathrm{~cm}$ $\rightarrow 102$ to $138 \mathrm{~N} \cdot \mathrm{~cm}$ ) <br> (4) Accessories: A spare fuse and a short chip for applied voltage select terminal are not included with the MELSEC iQ-R series power supply module. |
|  | A66P | No alternative models | Use a 24VDC power supply external to the programmable controller. Since the A66P is mounted on a slot for I/O modules, the corresponding slot of the MELSEC iQ-R series base unit will be empty. |
|  | A67P | No alternative models | Consider using the R63P (input power supply voltage: 24VDC) instead. When the R63P is used, the input voltage is required to be transformed to 24 VDC externally. |
|  | A68P | No alternative models | Use a $\pm 15 \mathrm{VDC}$ power supply external to the programmable controller. Since the A68P is mounted on a slot for I/O modules, the corresponding slot of the MELSEC iQ-R series base unit will be empty. |
|  | A1NCPU (power supply part) | R62P | (1) External wiring: Changed <br> (2) Slots: Changed (Integrated structure of the CPU and power supply part $\rightarrow$ single power supply module) <br> (3) Specifications: Rated output voltages (5VDC: $5 \mathrm{~A} \rightarrow 3.5 \mathrm{~A}, 24 \mathrm{VDC}: 0.8 \mathrm{~A} \rightarrow 0.6 \mathrm{~A}$ ), +24 and 24 G terminal screws (M4 screw $\rightarrow$ M3.5 screw), applicable tightening torque (M4 screw: 78 to $118 \mathrm{~N} \cdot \mathrm{~cm}$ $\rightarrow 102$ to $138 \mathrm{~N} \cdot \mathrm{~cm}$ ) <br> (4) Accessories: A spare fuse and a short chip for applied voltage select terminal are not included with the MELSEC iQ-R series power supply module. |

### 4.2 Specification Comparison Tables

## A61P/A61PN/A61P-UL and R61P

$\bigcirc$ : Compatible, $\triangle$ : Partly changed, $\times$ : Incompatible, 一: Not applicable

| Item |  | Specifications |  | Compatibility | Precautions |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | A61P/A61PN/A61P-UL | R61P |  |  |
| Input power supply voltage |  | $\begin{aligned} & 100 \text { to } 120 \mathrm{VAC}(+10 \%,-15 \%) \\ & (85 \text { to } 132 \mathrm{VAC}) \end{aligned}$ | 100 to 240VAC (+10\%, -15\%) ( 85 to 264VAC) | $\bigcirc$ | The R61P is a wide-range type applicable to 100 to 240VAC. |
|  |  | 200 to 240 VAC (+10\%, $-15 \%$ ) <br> (170 to 264VAC) |  |  |  |
| Input frequency |  | $50 / 60 \mathrm{~Hz} \pm 5 \%$ |  | $\bigcirc$ |  |
| Input voltage distortion factor |  | Within 5\% |  | $\bigcirc$ |  |
| Maximum input apparent power |  | 160VA | 130VA | $\bigcirc$ |  |
| Inrush current |  | 20A within 8 ms |  | $\bigcirc$ |  |
| Rated output current | 5VDC | 8A | 6.5A | $\triangle$ | Check the power consumption of the entire system. If the capacity is not enough, consider using the R64P (rated output current: 9A). |
|  | 24VDC | - |  | - |  |
| Overcurrent protection | 5VDC | 8.8A or higher | 7.1A or higher | $\bigcirc$ |  |
|  | 24VDC | - |  | - |  |
| Overvoltage protection | 5VDC | 5.5 to 6.5 V |  | $\bigcirc$ |  |
|  | 24VDC | - |  | - |  |
| Efficiency |  | 65\% or more | 76\% or more | $\bigcirc$ |  |
| Allowable momentary power failure time |  | Within 20 ms |  | $\bigcirc$ |  |
| Withstand voltage |  | 1500VAC for 1 minute between all AC external terminals and the ground 500 VAC for 1 minute between all DC external terminals and the ground | 2300 VAC rms per minute (altitude 0 to 2000 m ) between the combined "line input/LG terminals" and the "FG terminal and output" | $\bigcirc$ |  |
| Insulation resistance |  | $5 \mathrm{M} \Omega$ or higher by 500 VDC insulation resistance tester between all AC external terminals and the ground | $10 \mathrm{M} \Omega$ or higher by 500 VDC insulation resistance tester between the combined "line input/LG terminals" and the "FG terminal and output", the line input and LG terminals, the output and FG terminals | $\bigcirc$ |  |
| Noise immunity |  | Noise voltage 1500Vp-p | Noise voltage 1500 Vp -p, noise width $1 \mu \mathrm{~s}$, noise frequency 25 to 60 Hz (noise simulator condition) Noise immunity test IEC 61000-4-4: 2kV | $\bigcirc$ |  |
| Operation indication |  | POWER LED | POWER LED (Normal: On (green), Error: Off) | $\bigcirc$ |  |
| Fuse |  | Glass tube fuse (rated current: 4A, external dimensions: $\phi 6 \times 32 \mathrm{~mm}$, user-changeable) | Built-in (user-unchangeable) | - |  |

| Item |  | Specifications |  | Compatibility | Precautions |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | A61P/A61PN/A61P-UL | R61P |  |  |
| Contact output section | Application | None | ERR. contact | $\bigcirc$ |  |
|  | Rated switching voltage, current |  | 0.5 A at 24 VDC |  |  |
|  | Minimum switching load |  | 1 mA at 5VDC |  |  |
|  | Response time |  | Off $\rightarrow$ on: 10 ms or less On $\rightarrow$ off: 12 ms or less |  |  |
|  | Life |  | Mechanical: 20 million times or more <br> Electrical: Rated switching voltage/ current, 100 thousand times or more |  |  |
| Terminal screw size |  | $\mathrm{M} 4 \times 0.7 \times 6$ | M4.0 | $\bigcirc$ |  |
| Applicable wire size |  | 0.75 to $2 \mathrm{~mm}^{2}$ |  | $\bigcirc$ |  |

| Weight | 1.65 kg (including the CPU module) | 0.45 kg | - | The R62P is the single power supply module. |
| Accessories | Spare fuse: 1 <br> Short chip for applied voltage select terminal: 1 | None | - | A spare fuse is not included in the accessories of the MELSEC iQ-R series power supply module since fuses are not user-changeable, nor is the short chip since it is unnecessary to switch operating voltage. |

### 4.3 Precautions for Replacement

## Rated output current

The current consumption differs between the MELSEC-iQ-R series and MELSEC-A/QnA series modules. Calculate the current consumption for the entire system before selecting a power supply module.

## Input power supply voltage

The R61P and R62P are the wide-range type power supply module. They support input power supply voltages of both 100VAC and 200VAC

## Power capacity of the supply power

Select a power supply having enough power capacity for a power supply module.
(For an AC power supply module, the power capacity should be twice or more as large as the current consumption of the power supply module, and four times or more for a DC power supply module.)

## Large-capacity type power supply module

The MELSEC iQ-R series power supply module, R64P, is the large-capacity type (9A). If the current capacity is not enough, consider using the R64P.

```
Point \(\%\)
For details on these precautions, refer to the following
LDMELSEC iQ-R Module Configuration Manual
```

### 5.1 Alternative Model Lists

This section lists alternative models of the MELSEC iQ-R series base units and extension cables in accordance with the specifications of the MELSEC-A/QnA series base units and extension cables.
Select models that best suit your application considering the specifications of the MELSEC-A/QnA series base units and extension cables currently used.

## Base units

| Item | MELSEC-A/ QnA series | MELSEC iQ-R series | Specification difference |

| Cable length | 0.45m | - | A1SC05NB | RC06B | $\triangle$ | The cable length is changed from 0.45 m to 0.6 m . |
|  | 0.6 m | AC06B | - | RC06B | $\bigcirc$ | - |
|  | 0.7 m | - | A1SC07NB | RC06B | $\triangle$ | The cable length is changed from 0.7 m to 0.6 m . |
|  | 1.2 m | AC12B | - | RC12B | $\bigcirc$ | - |
|  | 3.0 m | AC30B | A1SC30NB | RC30B | $\bigcirc$ | - |
|  | 5.0 m | AC50B | A1SC50NB | RC50B | $\bigcirc$ | - |

### 5.3 Precautions for Replacement

## Base units

## Settings of number of slots in engineering tools

In the engineering tools for the MELSEC-A/QnA series, the number of slots is fixed to eight regardless of the actual number of slots on the base unit used. In the engineering tool of the MELSEC iQ-R series, however, the actual number of slots needs to be set.
When the base unit is replaced with the one having slots other than eight, set the number of slots.

## Base unit installation holes

Since the installation hole sizes differ between the MELSEC iQ-R series and MELSEC-A/QnA series, reworking installation holes to fix the base unit on the control panel is necessary.

By using the base adapter, the existing installation holes are reusable without rework.

## Internal current consumption (5VDC)

MELSEC iQ-R series base units consume 5VDC internally as well as CPU modules and I/O modules.
When calculating the internal current consumption (5VDC) of the entire system, consider the current consumption of the base unit.

## Extension cables

## Overall extension cable distance

Extension cables can be used up to 20.0 m for the MELSEC iQ-R series while they can be used up to 6.6 m for the MELSECA/QnA series. Select optimum cables for your system.

## Extension level setting

The extension level setting is not required in the MELSEC iQ-R series system while it needs to be configured with connector pins in the MELSEC-A/QnA series system.

For details on these precautions, refer to the following. LIMELSEC iQ-R Module Configuration Manual MEMORY AND BATTERY REPLACEMENT

### 6.1 Alternative Model List

This section lists alternative models of the MELSEC iQ-R series memory and batteries in accordance with the specifications of the MELSEC-A/QnA series memory and batteries. Select models that best suit your application considering the specifications of the MELSEC-A/QnA series memory and batteries currently used.

| Item | MELSEC-A/QnA series | MELSEC iQ-R series | Specification difference |
| :---: | :---: | :---: | :---: |
| Memory cassette | A3NMCA-0 | Not required | The RCPU is equipped with built-in program memory. Use SD memory cards and extended SRAM cassettes as required. |
|  | A3NMCA-2 |  |  |
|  | A3NMCA-4 |  |  |
|  | A3NMCA-8 |  |  |
|  | A3NMCA-16 |  |  |
|  | A3NMCA-24 |  |  |
|  | A3NMCA-40 |  |  |
|  | A3NMCA-56 |  |  |
|  | A3NMCA-2-UL |  |  |
|  | A3NMCA-4-UL |  |  |
|  | A3NMCA-8-UL |  |  |
|  | A3NMCA-16-UL |  |  |
|  | A3NMCA-24-UL |  |  |
|  | A3NMCA-40-UL |  |  |
|  | A3AMCA-96 |  |  |
|  | A4UMCA-128 |  |  |
|  | A4UMCA-8E |  |  |
|  | A4UMCA-32E |  |  |
|  | A4UMCA-128E |  |  |
| Memory card | Q1MEM-64S | Not required | Use SD memory cards and extended SRAM cassettes as required. |
|  | Q1MEM-128S |  |  |
|  | Q1MEM-256S |  |  |
|  | Q1MEM-512S |  |  |
|  | Q1MEM-1MS |  |  |
|  | Q1MEM-2MS |  |  |
|  | Q1MEM-64SE |  |  |
|  | Q1MEM-128SE |  |  |
|  | Q1MEM-256SE |  |  |
|  | Q1MEM-512SE |  |  |
|  | Q1MEM-1MSE |  |  |
| IC-RAM memory | 4KRAM | Not required | The RCPU is equipped with built-in program memory. Use SD memory cards and extended SRAM cassettes as required. |
| EP-ROM memory | 4KEROM | Not required | Use SD memory cards and extended SRAM cassettes as required. |
|  | 4KROM |  |  |
|  | 8KROM |  |  |
|  | 16KROM |  |  |
|  | 32KROM |  |  |
|  | 64KROM |  |  |
| Battery ${ }^{* 1 * 2}$ | A6BAT | Q6BAT | - |
|  | A8BAT | Q7BAT <br> Q7BATN |  |
|  | A10BAT |  |  |

*1 The R00CPU, R01CPU, and R02CPU do not require a battery. However, purchase the coin battery (FX3U-32BL) if retaining the clock data for more than 10 days is required. The clock data for five years can be retained.
*2 For the R04CPU, R08CPU, and R16CPU, the battery-less option cassette (NZ1BLC) eliminates the need for batteries. However, the clock data is no longer retained without a battery.

### 6.2 Precautions for Replacement

## Extended SRAM cassette

When there is not enough space on the standard RAM after replacement, for example, when multiple blocks of extended file register has been used, consider using an extended SRAM cassette.

## Battery

Replace the MELSEC-A series batteries (A6BAT, A8BAT and A10BAT) with the MELSEC iQ-R series batteries (Q6BAT, Q7BAT, and Q7BATN). (The R00CPU, R01CPU, and R02CPU do not require a battery. The R04CPU, R08CPU, and R16CPU include a Q6BAT battery as standard equipment.)
The battery life varies depending on operating conditions. For details, refer to the MELSEC iQ-R Module Configuration Manual.

For details on these precautions, refer to the following.
LDMELSEC iQ-R Module Configuration Manual
[]MMELSEC iQ-R CPU Module User's Manual (Startup)

### 7.1 Alternative Model List

This section lists alternative models of the MELSEC iQ-R series analog I/O modules in accordance with the specifications and functions of the MELSEC-A/QnA series analog I/O modules.
Select models that best suit your application considering the scope of control of MELSEC-A/QnA series analog I/O modules currently used, as well as the system specifications and extensibility after replacement.

### 7.2 Specification Comparison Tables

## Analog input modules

## A616AD and R60ADV8/R60ADI8

$\bigcirc$ : Compatible, $\triangle$ : Partly changed, $\times$ : Incompatible, 一: Not applicable

| Item | Specifications |  | Compatibility | Precautions |
| :---: | :---: | :---: | :---: | :---: |
|  | A616AD | R60ADV8/R60ADI8 |  |  |
| Number of analog input channels | 16 channels | 8 channels | $\triangle$ | When 9 or more channels are required, use multiple pieces of the R60ADV8/R60ADI8. |
| Analog input voltage | -10 to +10VDC (input resistance: <br> $1 \mathrm{M} \Omega$ ) | R60ADV8: -10 to 10VDC (input resistance: $1 \mathrm{M} \Omega$ ) <br> R60ADI8: - | $\triangle$ | Use either voltage input or current input for one module. A minus current cannot be used. |
| Analog input current | -20 to +20mADC (input resistance 250 () | R60ADV8: - <br> R60ADI8: 0 to 20mADC (input resistance 250 2 ) |  |  |
| Digital output value | 16-bit signed binary (data part: 12 bit): <br> -48 to $4047,-2048$ to 2047 <br> The range can be set for each channel. | 16-bit signed binary: <br> -32768 to 32767 | $\triangle$ | Use the scaling function to convert values to the same range as the A616AD. Converted values are stored in the buffer memory area 'Digital operation value'. |
| I/O characteristics, resolution | *1 | *2 | $\triangle$ | Use the scaling function to convert values to the same range as the A616AD. Converted values are stored in the buffer memory area 'Digital operation value'. |
| Overall accuracy (accuracy to full-scale) | When using the A616AD only 0 to $10 \mathrm{~V},-10$ to $10 \mathrm{~V},-5$ to 5 V , -20 to $20 \mathrm{~mA}: \pm 0.3 \%$ ( $\pm 12$ digit) 0 to $5 \mathrm{~V}, 1$ to $5 \mathrm{~V}, 0$ to $20 \mathrm{~mA}, 4$ to $20 \mathrm{~mA}: \pm 0.6 \%$ ( $\pm 24$ digit) When using the A616AD combined with the A60MX, the A60MXR, or the A60MXRN: the accuracy of each range of the A616AD is $\pm 0.3 \%$ ( $\pm 12$ digit). | Ambient temperature $25 \pm 5^{\circ} \mathrm{C}$ : <br> Within $\pm 0.1 \%$ ( $\pm 32$ digit) <br> Ambient temperature 0 to $55^{\circ} \mathrm{C}$ : <br> Within $\pm 0.3 \%$ ( $\pm 96$ digit) | $\bigcirc$ | The accuracy to full-scale is applied to the A616AD, while the accuracy to maximum digital output value is applied to the R60ADV8/R60ADI8. |
| Conversion speed | When using the A616AD only: <br> $1 \mathrm{~ms} /$ channel <br> When using the A616AD combined with the A60MX: $1 \mathrm{~ms} /$ channel When using the A616AD combined with the $\operatorname{A60MXR}(\mathrm{N})$ : $1 \mathrm{~ms} /$ channel (at sampling processing), $7.0 \mathrm{~ms} /$ channel (at direct access processing) | 80 $\mu$ s/channel | $\bigcirc$ | Comparing with the A616AD, the conversion speed of the R60ADV8/ R60ADI8 is faster. <br> Therefore, for the R60ADV8/ R60ADI8, some noise may be taken in as analog signals, which is not the case with the A616AD. In this case, use the averaging processing function to eliminate noise effect. |
| Absolute maximum input | Voltage: $\pm 15 \mathrm{~V}$, current: $\pm 30 \mathrm{~mA}$ | R60ADV8: Voltage: $\pm 15 \mathrm{~V}$ R60ADI8: Current: 30mA | $\bigcirc$ |  |
| Number of writes of offset/gain values | - | 50000 times maximum | - |  |
| Isolation method | Between the input terminal and programmable controller: <br> Photocoupler <br> Between channels: Non-isolation <br> ( $1 \mathrm{M} \Omega$ resistor isolation) | Between the I/O terminal and programmable controller power supply: Photocoupler <br> Between input channels: Nonisolation | $\bigcirc$ |  |
| External interface | 38-point terminal block (M3×6 screws) | 18-point terminal block (M3 screws) | $\times$ | Wiring needs to be changed after replacement. <br> By using the upgrade tool conversion adapter (ERNT1AR616AD), the existing external wiring and terminal blocks in the existing system can be used. ${ }^{* 3}$ |
| Applicable wire size | 0.75 to $2 \mathrm{~mm}^{2}$ | 0.3 to $0.75 \mathrm{~mm}^{2}$ ( 22 to 18 AWG) | $\times$ |  |
| Applicable solderless terminal | $\begin{aligned} & \text { V1.25-3, V1.25-YS3A, V2-S3, V2- } \\ & \text { YS3A } \end{aligned}$ | R1.25-3 (solderless terminal with an insulation sleeve cannot be used) | $\times$ |  |

| Item | Specifications |  | Compatibility | Precautions |
| :--- | :--- | :--- | :--- | :--- |
|  | A616AD | R60ADV8/R60ADI8 |  |  |

| Function |  | MELSEC-A/ QnA series | MELSEC IQ-R series | Precautions |
| :---: | :---: | :---: | :---: | :---: |
|  |  | A68RD3N | R60RD8-G |  |
| Conversion enable/ disable specification of each channel | Enables/disables a detection of temperature. | $\bigcirc$ | $\bigcirc$ |  |
| Sampling/averaging processing selection | Processes the detected temperature by specified method. | $\bigcirc$ | $\bigcirc$ |  |
| Detected temperature value storage | Stores temperature data in the buffer memory. | $\bigcirc$ | $\bigcirc$ |  |
| Disconnection detection | Detects a disconnection of connected RTDs or cables. | $\bigcirc$ | $\bigcirc$ |  |
| Specification of RTD type | Specifies an RTD type to be used. | $\bigcirc$ | $\bigcirc$ |  |
| Error correction function | Corrects an error in temperature conversion values. | $\bigcirc$ | $\bigcirc$ | Correct the error using the offset/ gain setting of the R60RD8-G. |

### 7.4 Precautions for Replacement

#### Abstract

Wiring The sizes of wires or solderless terminals that can be used for terminal blocks vary between MELSEC iQ-R series and MELSEC-A/QnA series, since modules and terminal blocks of the MELSEC $i Q-R$ series are smaller than those of the MELSEC-A/QnA series.

When replacing MELSEC-A/QnA series modules with MELSEC Q -R series modules, use wires and solderless terminals that meet the specifications of MELSEC iQ-R series modules.

The wiring change is not required when the upgrade tool conversion adapter is used for replacement.

## Dedicated instructions

Dedicated instructions vary between the MELSEC-A/QnA series and the MELSEC iQ-R series.
If a dedicated instruction is used in a MELSEC-A/QnA series program, the program needs to be corrected for MELSEC iQ-R series.

## I/O signals and buffer memory areas

The layouts of I/O signals and buffer memory areas vary between the MELSEC-A/QnA series and the MELSEC iQ-R series. If an I/O signal or a buffer memory area is used in a MELSEC-A/QnA series program, the program needs to be corrected for the MELSEC iQ-R series.

## Resolution mode switching function

The MELSEC iQ-R series modules do not support the resolution mode switching function because the resolution has already been enhanced.
Values are converted to the range equivalent to that of MELSEC-A/QnA series by using the scaling function.

## Temperature conversion system

For the MELSEC iQ-R series, setting values of the averaging processing in the temperature conversion system are changed because the conversion speed is enhanced. When the averaging processing is used in a MELSEC-A/QnA series program, the program needs to be corrected for the MELSEC iQ-R series.

## Disconnection detection function

When the analog output range of a MELSEC iQ-R series analog output module is 4 to 20 mA , this function operates all the time.
When disconnection detection is not required, set another analog output range.

### 8.1 Alternative Model List

This section lists alternative models of the MELSEC iQ-R series positioning modules and pulse I/O modules in accordance with the specifications and functions of the MELSEC-A/QnA series positioning modules and pulse I/O modules.
Select models that best suit your application considering the scope of control of MELSEC-A/QnA series positioning modules and pulse I/O modules that are currently used, as well as the system specifications and extensibility after replacement.

## High-speed counter modules

## AD61 and RD62P2

$\bigcirc$ : Compatible, $\triangle$ : Partly changed, $\times$ : Incompatible, 一: Not applicable

| Item |  | Specifications |  | Compatibility | Precautions |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | AD61 | RD62P2 |  |  |
| Number of channels |  | 2 channels |  | $\bigcirc$ |  |
| Counting speed switch setting |  | - | ```200kpps (100k to 200kpps), 100kpps (10k to 100kpps), 10kpps (10kpps or less)``` | $\bigcirc$ | Set the counting speed switch setting of parameters to 100kpps. |
| Count input signal | Phase | 1-phase input, 2-phase input | 1-phase input (1 multiple/2 multiples), 2-phase input (1 multiple/ 2 multiples/4 multiples), CW/CCW input | $\bigcirc$ |  |
|  | Signal level ( $\phi \mathrm{A}$, фB) | $5 / 12 / 24 \mathrm{VDC}, 2$ to 5 mA |  | $\bigcirc$ |  |
| Counter | Counting speed (maximum) | 1-phase input: 50KPPS <br> 2-phase input: 50KPPS | When 200k is set: 200kpps When 100 k is set: 100 kpps When 10 k is set: 10 kpps | $\triangle$ | *1 |
|  | Counting range | 24-bit unsigned binary: <br> 0 to 16777215 | 32-bit signed binary: <br> -2147483648 to 2147483647 | $\triangle$ | Data is changed from 24-bit unsigned binary to 32-bit signed binary. |
|  | Type | UP/DOWN preset counter + ring counter function |  | $\bigcirc$ |  |
|  | Minimum count pulse width (duty ratio: 50\%) | $20 \mu \mathrm{~s}$ ( $10 \mu \mathrm{~s}$ for each ON/OFF) | *2 | $\bigcirc$ |  |
| Magnitude comparison | Comparison range | 24-bit unsigned binary | 32-bit signed binary | $\triangle$ | Data is changed from 24-bit unsigned binary to 32-bit signed binary. |
|  | Comparison result | Set value < Count value, Set value $=$ Count value, Set value $>$ Count value |  | $\bigcirc$ |  |
| External input | Preset | 5VDC 5mA, 12/24VDC 3/6mA | 5/12/24VDC, 7 to 10 mA | $\triangle$ | The external input specifications are different. Check the specifications of external devices. |
|  | Count disable | 5VDC 5mA, 12/24VDC 3/6mA | - |  |  |
|  | Function start | - | $5 / 12 / 24 \mathrm{VDC}, 7$ to 10 mA |  |  |
| External output | Coincidence output | Transistor (open collector) output 12/24VDC 0.5A | Transistor (sink type) output 2 points/channel $12 / 24 \mathrm{VDC}, 0.5 \mathrm{~A} /$ point, $2 \mathrm{~A} /$ common Current consumption of the external auxiliary power supply: 43 mA (TYP., 24VDC and all points ON/common) | $\triangle$ | The external output specifications are different. Check the specifications of external devices. |
| External interface |  | 38-point terminal block (M3×6 screws) | 40-pin connector (A6CON1/2/4) | $\times$ | Wiring needs to be changed after replacement. By using the upgrade tool conversion adapter (ERNT1AR61D), the existing external wiring and terminal blocks in the existing system can be used. ${ }^{* 3}$ |
| Applicable wire size |  | 0.75 to $2 \mathrm{~mm}^{2}$ | 0.088 to $0.3 \mathrm{~mm}^{2}$ | $\times$ |  |
| Applicable solderless terminal |  | R1.25-3, R2-3, RAV1.25-3, RAV2-3 | - | - |  |
| Number of occupied I/O points |  | 32 points (I/O assignment: Special 32 points) | 16 points (I/O assignment: Intelligent 16 points) | $\triangle$ | The number of occupied I/O points is changed after replacement. |
| Internal current consumption (5VDC) |  | 0.30A (TYP. all points ON) | 0.11 A (TYP. all points ON) | - |  |
| External dimensions |  | 250(H) $\times 37.5(\mathrm{~W}) \times 131$ (D) mm | 106(H) $\times 27.8$ (W) $\times 111$ (D)mm | - |  |
| Weight |  | 0.50 kg | 0.11 kg | - |  |

*1 The counting speed is affected by the rise/fall time of pulses. A count can be performed with the following counting speed.
AD61

| Rise/fall time | Common to 1-phase input and 2-phase input |
| :--- | :--- |
| $t=5 \mu \mathrm{~s}$ | 50 KPPS |
| $\mathrm{t}=50 \mu \mathrm{~s}$ | 5 KPPS |

RD62P2

| Counting speed switch setting | 200kpps | 100kpps | 10kpps |
| :--- | :--- | :--- | :--- |
| Rise/fall time | Common to 1-phase input and 2-phase input |  |  |
| $\mathrm{t}=1.25 \mu \mathrm{~s}$ or less | 200kpps | 100 kpps | 10 kpps |
| $\mathrm{t}=2.5 \mu \mathrm{~s}$ or less | 100 kpps | 100 kpps | 10 kpps |
| $\mathrm{t}=25 \mu \mathrm{~s}$ or less | - | 10 kpps | 10 kpps |
| $\mathrm{t}=500 \mu \mathrm{~s}$ or less | - | - | 500 pps |

*2 The following table shows the minimum count pulse width for the RD62P2.

| Pulse input mode | Waveform (in up count, duty ratio: 50\%) | Minimum count pulse cycle, T, and phase difference, $\mathbf{t}(\mu \mathrm{s})$, at each counting speed |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | 200kpps | 100kpps | 10kpps |
| 1-phase multiple of 1 |  | T = 5 | $\mathrm{T}=10$ | T = 100 |
| 1-phase multiple of 2 |  | $\mathrm{T}=10$ | $\mathrm{T}=20$ | $\mathrm{T}=200$ |
| CW/CCW |  | $\mathrm{T}=5$ | $\mathrm{T}=10$ | $\mathrm{T}=100$ |
| 2-phase multiple of 1 |  | $\begin{aligned} & \mathrm{T}=5 \\ & \mathrm{t}=1.25 \end{aligned}$ | $\begin{aligned} & T=10 \\ & t=2.5 \end{aligned}$ | $\begin{aligned} & T=100 \\ & t=25 \end{aligned}$ |
| 2-phase multiple of 2 |  | $\begin{aligned} & \mathrm{T}=10 \\ & \mathrm{t}=2.5 \end{aligned}$ | $\begin{aligned} & T=20 \\ & t=5 \end{aligned}$ | $\begin{aligned} & T=200 \\ & t=50 \end{aligned}$ |

| Pulse input mode | Waveform (in up count, duty ratio: 50\%) | Minimum count pulse cycle, T, and phase difference, $\mathbf{t}(\mu \mathrm{s})$, at each counting speed |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | 200kpps | 100kpps | 10kpps |
| 2-phase multiple of 4 |  | $\begin{aligned} & T=20 \\ & t=5 \end{aligned}$ | $\begin{aligned} & T=40 \\ & t=10 \end{aligned}$ | $\begin{aligned} & T=400 \\ & t=100 \end{aligned}$ |

*3 For an upgrade tool, please consult your local Mitsubishi Electric representative.

## AD61S1 and RD62P2

$\bigcirc$ : Compatible, $\triangle$ : Partly changed, $\times$ : Incompatible, 一: Not applicable

### 8.3 Function Comparison Tables

## Positioning modules

## AD75P1-S3/AD75P2-S3/AD75P3-S3 and RD75P2/RD75P4/RD75D2/RD75D4

-Main functions
O: Compatible/function available, $\triangle$ : Partly changed, $\times$ : Incompatible/function not available, 一: Not applicable

| Function |  | MELSEC-A/ QnA series | MELSEC iQ-R series | Precautions |
| :---: | :---: | :---: | :---: | :---: |
|  |  | AD75P1-S3 <br> AD75P2-S3 <br> AD75P3-S3 | RD75P2 <br> RD75P4 <br> RD75D2 <br> RD75D4 |  |
| OPR control | - Machine OPR control <br> Mechanically establishes the positioning start point using a nearpoint dog or stopper. (Positioning start No.9001) <br> - Fast OPR control <br> Positions a target to the OP address (Md.43) stored in the module using machine OPR. (Positioning start No.9002) | $\bigcirc$ | $\bigcirc$ |  |
| Position control | - Linear control (1-axis linear control, 2-axis linear interpolation control) <br> Positions a target using a linear path to the address set in the positioning data or to the position specified with the movement amount. <br> - Fixed-feed control (1-axis fixed-feed control, 2-axis fixed-feed control) <br> Positions a target by the movement amount using the amount set in the positioning data. (With the fixed-feed control, [Md.29] <br> Current feed value is set to 0 when the control is started. In the 2axis fixed-feed control, the fixed-feed is performed along a linear path obtained by interpolation.) <br> - 2-axis circular interpolation control <br> Positions a target using an arc path to the address set in the positioning data, or to the position specified with the movement amount, sub point, or center point. | $\bigcirc$ | $\bigcirc$ |  |
| Speed control | Continuously outputs the pulses corresponding to the command speed set in the positioning data. | $\bigcirc$ | $\bigcirc$ |  |
| Speed-position switching control | Performs the speed control, and position control (positioning with the specified movement amount) immediately after that by turning on Speed-position switching signal. | $\bigcirc$ | $\bigcirc$ |  |
| Current value changing | Changes [Md.29] Current feed value to the address set in the positioning data. <br> The following two methods can be used. (Machine feed value cannot be changed.) <br> - Current value changing using positioning data <br> - Current value changing using the current value changing start No. (No.9003) | $\bigcirc$ | $\bigcirc$ |  |
| JUMP instruction | Unconditionally or conditionally jumps to the specified positioning data No. | $\bigcirc$ | $\bigcirc$ |  |
| Block start (normal start) | With one start, executes the positioning data in a random block with the set order. | $\bigcirc$ | $\bigcirc$ |  |
| Condition start | Judges the condition set in Condition data for the specified positioning data, and executes Block start data. <br> When the condition is established, Block start data is executed. When not established, that block start data is ignored, and the next point's block start data is executed. | $\bigcirc$ | $\bigcirc$ |  |
| Wait start | Judges the condition set in Condition data for the specified positioning data, and executes Block start data. <br> When the condition is established, Block start data is executed. When not established, the control stops (waits) until the condition is established. | $\bigcirc$ | $\bigcirc$ |  |

| Function |  | MELSEC-A/ <br> QnA series | MELSEC iQ-R <br> series | Precautions |
| :--- | :--- | :--- | :--- | :--- |
|  |  | AD75P1-S3 <br> AD75P2-S3 <br> RD75P2 <br> RD75P4 <br> RD75D2 <br> RD75D4 |  |  |

## Sub functions

O: Compatible/function available, $\triangle$ : Partly changed, $\times$ : Incompatible/function not available, 一: Not applicable

| Function |  | MELSEC-A/ QnA series | MELSEC iQ-R series | Precautions |
| :---: | :---: | :---: | :---: | :---: |
|  |  | AD75P1-S3 <br> AD75P2-S3 <br> AD75P3-S3 | RD75P2 <br> RD75P4 <br> RD75D2 <br> RD75D4 |  |
| OPR retry function | Retries the machine OPR with the upper/lower limit switches during the machine OPR. This allows the machine OPR to be performed even if the axis is not returned to a position before the near-point dog with operations such as the JOG operation. | $\bigcirc$ | $\bigcirc$ |  |
| OP shift function | After the machine OPR, this function compensates the position by the specified distance from the machine OP position and sets that position as the OP address. | $\bigcirc$ | $\bigcirc$ |  |
| Backlash compensation function | Compensates the backlash amount of the machine system. Feed pulses equivalent to the set backlash amount are output each time the movement direction changes. | $\bigcirc$ | $\bigcirc$ |  |
| Electronic gear function | By setting the movement amount per pulse, this function can freely change the machine movement amount per commanded pulse. A flexible positioning system that matches the machine system can be structured by setting the movement amount per pulse. | $\bigcirc$ | $\bigcirc$ |  |
| Near pass mode function | Suppresses the machine vibration when the speed is changed during continuous path control in the interpolation control. | $\bigcirc$ | $\bigcirc$ |  |
| Speed limit function | If the command speed exceeds [Pr.7] Speed limit value during the control, this function limits the command speed to within the setting range of [Pr.7] Speed limit value. | $\bigcirc$ | $\bigcirc$ |  |
| Torque limit function | If the torque generated in the servo motor exceeds [Pr.18] Torque limit setting value during the control, this function limits the generated torque to within the setting range of [Pr.18] Torque limit setting value. | $\bigcirc$ | $\bigcirc$ |  |
| Software stroke limit function | If a command outside of the upper/lower limit stroke limit setting range, set in the parameters, is issued, this function will not execute the positioning for that command. | $\bigcirc$ | $\bigcirc$ |  |
| Hardware stroke limit function | Performs the deceleration stop with the limit switch connected to the connector for external devices. | $\bigcirc$ | $\bigcirc$ |  |
| Speed change function | Changes the speed during positioning. Set the new speed in [Cd.16] New speed value, the speed change buffer memory area, and change the speed with [Cd.17] Speed change request. | $\bigcirc$ | $\bigcirc$ |  |
| Override function | Changes the speed during positioning within a percentage of 1 to $300 \%$. Execute this function using [Cd.18] Positioning operation speed override. | $\bigcirc$ | $\bigcirc$ |  |

## Common functions

$\bigcirc$ ：Compatible／function available，$\triangle$ ：Partly changed，$\times$ ：Incompatible／function not available，一：Not applicable

| Function |  | MELSEC－A／ QnA series | MELSEC IQ－R series | Precautions |
| :---: | :---: | :---: | :---: | :---: |
|  |  | AD75P1－S3 <br> AD75P2－S3 <br> AD75P3－S3 | RD75P2 <br> RD75P4 <br> RD75D2 <br> RD75D4 |  |
| Parameter initialization function | Resets the setting data stored in the flash ROM of the module to the factory default values．The following two methods can be used． <br> （1）Method using a sequence program <br> （2）Method using software package | $\bigcirc$ | $\triangle$ | For the RD75Pロ／Dロ，use the module data initialization function instead． <br> Only the method using a sequence program is supported． |
| Execution data backup function | Stores the setting data currently being executed into the flash ROM．The following two methods can be used． <br> （1）Method using a sequence program <br> （2）Method using software package | $\bigcirc$ | $\triangle$ | For the RD75PD／DD，use the module data backup function instead． Only the method using a sequence program is supported． |
| LED indication function | Indicates the module operating status，signal status，or error status with a 17 －segment LED on the front of the module．What status the LED indicates is switched using the mode switch on the front of the module． | $\bigcirc$ | $\times$ | The LED indication function is not available． |
| Clock data function | Sets the clock data of the programmable controller CPU to the module．The set clock data are used for history data． | $\bigcirc$ | $\bigcirc$ |  |

## High-speed counter modules

## AD61/AD61S1 and RD62P2

$\bigcirc$ : Compatible/function available, $\triangle$ : Partly changed, $\times$ : Incompatible/function not available, 一: Not applicable

| Function |  | MELSEC-A/ <br> QnA series | MELSEC iQ-R <br> series | Precautions |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  |  | AD61 <br> AD61S1 | RD62P2*1 |  |

*1 The counter operation mode for the RD62P2 is pulse count mode.

### 8.4 Precautions for Replacement

## Wiring

For positioning modules, the external wiring connectors to be used differ between the MELSEC-A/QnA series and the MELSEC iQ-R series. And wire sizes applicable to the connectors differ accordingly.
For high-speed counter modules, MELSEC-A/QnA series uses a terminal block while MELSEC iQ-R series uses a connector. When using a MELSEC iQ-R series high-speed counter module, use connectors for wiring instead of terminal blocks, or use an upgrade tool conversion adapter.

## External interface specifications

The external interface specifications differ between the MELSEC-A/QnA series and the MELSEC iQ-R series. Check that connections to external devices meet the specifications.

## Dedicated instructions

The dedicated instructions differ between the MELSEC-A/QnA series and the MELSEC iQ-R series.
If a dedicated instruction is used in a MELSEC-A/QnA series program, the program needs to be corrected for MELSEC iQ-R series.

## I/O signals and buffer memory areas

The layouts of I/O signals and buffer memory areas differ between the MELSEC-A/QnA series and the MELSEC iQ-R series. If an I/O signal or a buffer memory area is used in a MELSEC-A/QnA series program, the program needs to be corrected for the MELSEC $\mathrm{iQ}-\mathrm{R}$ series.

Point ${ }^{\circ}$<br>For details on these precautions, refer to the following.<br>LIMMELSEC iQ-R Module Configuration Manual<br>LDMELSEC iQ-R Positioning Module User's Manual (Startup)<br>LDMELSEC iQ-R Positioning Module User's Manual (Application)<br>LDMELSEC iQ-R High-Speed Counter Module User's Manual (Startup)<br>LDMELSEC iQ-R High-Speed Counter Module User's Manual (Application)

### 9.1 Alternative Model List

This section lists alternative models of the MELSEC iQ-R series control network modules in accordance with the specifications and functions of the MELSEC-A/QnA series control network modules.
Select models that best suit your application considering the scope of control of MELSEC-A/QnA series control network modules currently used, as well as the system specifications and extensibility after replacement.

| Item | MELSEC-A/ QnA series | MELSEC iQ-R series | Specification difference |

| B/NET | AJ71B62-S3 | None | Consider replacing the existing system with a system on other networks. |

### 9.2 Specification Comparison Tables

## CC-Link system master/local modules

## AJ61BT11/AJ61QBT11 and RJ61BT11 <br> $\bigcirc$ : Compatible, $\triangle$ : Partly changed, $\times$ : Incompatible, 一: Not applicable

| Item | Specifications |  | Compatibility | Precautions |
| :---: | :---: | :---: | :---: | :---: |
|  | AJ61BT11/AJ61QBT11 | RJ61BT11 |  |  |
| Transmission speed | Selected from 156 kbps , 625 kbps , 2.5 Mbps , 5 Mbps , and 10 Mbps . |  | $\bigcirc$ |  |
| Maximum number of connected modules (master station) | 64 |  | $\bigcirc$ |  |
| Number of occupied stations (local station) | 1 to 4 |  | $\bigcirc$ |  |
| Maximum number of link points per system | $\begin{aligned} & \text { Remote I/O (RX, RY): } 2048 \\ & \text { Remote register (RWw): } 256 \\ & \text { Remote register (RWr): } 256 \end{aligned}$ |  | $\bigcirc$ |  |
| Link points per station | Remote I/O (RX, RY): 32 (30 for a local station) <br> Remote register (RWw): 4 <br> Remote register (RWr): 4 |  | $\bigcirc$ |  |
| Communication method | Broadcast polling method |  | $\bigcirc$ |  |
| Synchronization method | Frame synchronization method |  | $\bigcirc$ |  |
| Encoding method | NRZI method |  | $\bigcirc$ |  |
| Transmission method | Bus (RS-485) |  | $\bigcirc$ |  |
| Transmission format | HDLC standards |  | $\bigcirc$ |  |
| Error control system | $\operatorname{CRC}\left(X^{16}+X^{12}+X^{5}+1\right)$ |  | $\bigcirc$ |  |
| Connection cable | - Ver.1.10-compatible CC-Link dedicated cable <br> - CC-Link dedicated cable (Ver.1.00compatible) <br> - CC-Link dedicated highperformance cable (Ver.1.00compatible) | - Ver.1.10-compatible CC-Link dedicated cable | $\triangle$ | Only Ver.1.10-compatible CC-Link dedicated cable can be used. |
| Maximum overall cable distance (maximum transmission distance) | Depends on the transmission speed. For details, refer to the relevant manuals. |  | $\bigcirc$ |  |
| RAS function | Standby master function, automatic return function, local station cut-off function, <br> Error detection using link special relay areas (SB) and link special register areas (SW) |  | $\bigcirc$ |  |
| Number of parameter registrations to $\mathrm{E}^{2}$ PROM | 10,000 times | - | $\triangle$ | Set parameters using by GX Works3. |
| External interface | 10-point terminal block (M3 screws) | 7-point terminal block (M3) | $\times$ | Wiring needs to be changed |
| Applicable wire size | 0.3 to $1.25 \mathrm{~mm}^{2}$ |  | $\bigcirc$ | after replacement. |
| Applicable solderless terminal | R1.25-3 (solderless terminal with an insulation sleeve cannot be used.) |  | $\bigcirc$ |  |
| Number of occupied I/O points | 32 (I/O assignment: special 32 points) | 32 (//O assignment: Intelligent 32 points) | $\bigcirc$ |  |
| Internal current consumption (5VDC) | 0.45A | 0.34A | - |  |
| External dimensions | $250(\mathrm{H}) \times 37.5(\mathrm{~W}) \times 129.1(\mathrm{D}) \mathrm{mm}$ | 106(H) $\times 27.8(\mathrm{~W}) \times 131$ (D) mm | - |  |
| Weight | 0.40 kg | 0.16 kg | - |  |

## MELSECNET/10 network modules

AJ71LP21/AJ71QLP21 and RJ71LP21-25
$\bigcirc$ : Compatible, $\triangle$ : Partly changed, $\times$ : Incompatible, 一: Not applicable

| Item |  | Specifications |  | Compatibility | Precautions |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | AJ71LP21/AJ71QLP21 | RJ71LP21-25 <br> (MELSECNET/10 mode) |  |  |
| Maximum number of link points per network | LB | 8192 |  | $\bigcirc$ |  |
|  | LW |  |  |  |  |
|  | LX | 8192 |  |  | $\bigcirc$ |  |
|  | LY |  |  |  |  |
| Maximum number of link points per station | LB | $\{(\mathrm{LY}+\mathrm{LB}) \div 8+(2 \times \mathrm{LW})\} \leq 2000$ bytes |  | $\bigcirc$ |  |
|  | LW |  |  |  |  |
|  | LX |  |  |  |  |
|  | LY |  |  |  |  |
| Communication speed |  | 10Mbps |  |  | $\bigcirc$ |  |
| Number of connected stations per network |  | 64 (control station: 1, normal station: 63) |  |  | $\bigcirc$ |  |
| Connection cable |  | Optical fiber cable (Obtained by user) |  |  | $\bigcirc$ |  |
| Overall distance |  | 30km |  | $\bigcirc$ |  |
| Station-to-station distance |  | SI optical cable: 500 m H-PCF optical cable: 1 km Broad-band H-PCF optical cable: 1 km QSI optical cable: 1 km |  | $\bigcirc$ |  |
| Maximum number of networks |  | AJ71LP21: 255 (The sum total of PLC to PLC network and remote I/O network) <br> AJ71QLP21: 239 (The sum total of PLC to PLC network and remote I/O network) | 239 (The sum total of PLC to PLC network and remote I/O network) | $\triangle$ | Network numbers 240 to 250 cannot be set after replacement. Set other unused network numbers instead. |
| Maximum number of groups |  | 9 |  | $\bigcirc$ |  |
| Transmission route format |  | Duplex loop |  | $\bigcirc$ |  |
| Communication method |  | Token ring |  | $\bigcirc$ |  |
| Error control system |  | Retry by CRC ( $\left.\mathrm{X}^{16}+\mathrm{X}^{12}+\mathrm{X}^{5}+1\right)$ and overtime |  | $\bigcirc$ |  |
| RAS function |  | - Loop back function due to abnormality detection and cable disconnection <br> - Diagnostic function for local link circuit check <br> - Prevention of system down due to shifting to control station <br> - Abnormality detection by link special relay and link special resistor |  | $\bigcirc$ |  |
| Transient transmission |  | - $\mathrm{N}: \mathrm{N}$ communication (Monitor, program upload/download, etc.) <br> - Link dedicated instructions (ZNRD, ZNWR) | - $\mathrm{N}: \mathrm{N}$ communication (Monitor, program upload/download, etc.) <br> - Send/receive instructions to/from a sequence program (ZNRD/ZNWR, SEND/RECV, RECVS, READ/ WRITE, SREAD/SWRITE, REQ, RRUN/RSTOP, RTMRD/RTMWR) <br> - Function for sending message to channel numbers 1 to 8 | $\bigcirc$ |  |
| Number of occupied I/O points |  | 32 (I/O assignment: special 32 points) | 32 (I/O assignment: Intelligent 32 points) | $\bigcirc$ |  |
| Internal current consumption (5VDC) |  | 0.65A | 0.48A | - |  |
| Weight |  | $0.31 \mathrm{~kg}^{* 1}$ | 0.15 kg | - |  |

*1 For the AJ71LP21 with the hardware version P or earlier and the AJ71QLP21 with the hardware version M or earlier, the weight is 0.45 kg .

### 9.3 Function Comparison Tables

## CC-Link system master/local modules

## AJ61BT11/AJ61QBT11 and RJ61BT11 <br> $\bigcirc$ : Compatible/function available, $\triangle$ : Partly changed, $\times$ : Incompatible/function not available, 一: Not applicable

| Function |  | MELSEC-A/QnA series |  | MELSEC IQ-R <br> series <br> RJ61BT11 | Precautions |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | AJ61BT11 | AJ61QBT11 |  |  |
| Communication between master station and remote I/O station | Communicates ON/OFF information with a remote I/O station. | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |
| Communication between master and remote device stations | Communicates ON/OFF information and numerical data with a remote device station. | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |
| Communication between master station and local station | Communicates ON/OFF information and numerical data with a local station. | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |
| Communication between master and intelligent device stations | Communicates with intelligent device station using cyclic transmission and transient transmission. | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |
| Reserved station function | By setting a remote station and local station, which are to be connected in the future, as reserved stations, these stations are not treated as data link faulty stations. <br> If a connected module is specified, no data link is available. | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |
| Error invalid station setting function | Prevents the remote stations and local stations that cannot perform data link due to reasons such as power-off from detecting as data link faulty stations. | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |
| Data link status setting at master station programmable controller CPU error | Sets the data link status when an operation continuation error occurs programmable controller CPU of the master station. | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |
| Parameter registration to $E^{2}$ PROM | Parameter writing is not required at each startup of master module by registering parameters to $\mathrm{E}^{2} \mathrm{PROM}$ of master module. | $\bigcirc$ | $\bigcirc$ | $\triangle$ | Set parameters using by GX Works3. |
| Data link faulty station input data status setting | Sets the input (received) data status (cleared/ held) from the station that has data link error caused by reasons such as power-off. | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |
| Module reset function by sequence program | Resets the module by the sequence program without resetting programmable controller CPU when the switch setting is changed or an error has occurred in a module. | $\bigcirc$ | $\bigcirc$ | $\times$ | The module reset function by sequence program cannot be used. |
| Data link stop/restart | Stops and restarts a data link during the data link execution. | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |
| Automatic return function | When a module that has been disconnected from data link due to reasons such as power-off returns to the normal status, data link is automatically restarted. | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |
| Local station cut-off function | Data link can be continued in a normal module by disconnecting a module that cannot perform data link due to reasons such as power-off. | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |
| Data link status check (SB/SW) | Data link status can be checked. Checking the status such as the interlock of sequence program can be used. | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |

| Function |  | MELSEC-A/QnA series |  | MELSEC iQ-R <br> series <br> RJ61BT11 | Precautions |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | AJ61BT11 | AJ61QBT11 |  |  |
| Offline test | Hardware test: Module operation check Line test: Module connection status check Parameter check test: Parameter setting check | $\bigcirc$ | $\bigcirc$ | $\triangle$ | The parameter check test cannot be used. |
| Scan synchronous function | Synchronous mode: Data link with scan synchronized with sequence program is available. <br> Asynchronous mode: Data link not synchronized with sequence program is available. | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |
| Standby master function | Data link can be continued by switching to the standby master station when an error occurs in the master station. | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |
| Dedicated instruction (RIRD, RIWT, RIRCV, RISEND, RIFR, RITO) | Enables transient transmission to an intelligent device station and a local station using dedicated instructions. | $\bigcirc$ | $\bigcirc$ | $\triangle$ | The instruction formats are different. |
| Send/receive instruction (SEND, RECV, READ, SREAD, WRITE, SWRITE, REQ) | Enables data sending/receiving to/from other stations on CC-Link. Reading/writing data from/ to other stations is also available. | $\times$ | $\bigcirc$ | $\bigcirc$ |  |
| Remote I/O net mode | Enables communications between the master station and a remote I/O station only. | $\bigcirc$ | $\bigcirc$ | $\triangle$ | Set parameters using by GX Works3. |
| Temporary error invalid station specify function | Enables module replacement without detecting an error of the faulty remote station during online. | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |
| Online test function | Enables line test, link start/stop, and other operations by GX Developer. | $\times$ | $\bigcirc$ | $\bigcirc$ |  |
| Monitoring and diagnostics | Enables monitoring and diagnosing by GX Developer. | $\times$ | $\bigcirc$ | $\bigcirc$ |  |

## AJ71LP21 and RJ71LP21-25

$\bigcirc$ : Compatible/function available, $\triangle$ : Partly changed, $\times$ : Incompatible/function not available, 一: Not applicable

| Function |  | MELSEC-A <br> series | MELSEC iQ-R series | Precautions |
| :---: | :---: | :---: | :---: | :---: |
|  |  | AJ71LP21 | RJ71LP21-25 <br> (MELSECNET/ <br> 10 mode) |  |
| ■Cyclic transmission |  |  |  |  |
| Communications with B/W (1:N communication) | Allows data transmission to all the stations using the link relay and the link register. (Communications using B/W) | $\bigcirc$ | $\bigcirc$ |  |
| Communications with $\mathrm{X} / \mathrm{Y}$ <br> (1:1 communication) | Allows data communications between the I/O master station and one of the other stations (one-to-one communications). (Communications using $\mathrm{X} / \mathrm{Y}$ ) | $\bigcirc$ | $\bigcirc$ |  |
| Constant link scan function | Maintains the link scan time at a constant value. | $\bigcirc$ | $\bigcirc$ |  |
| Data link/stop/restart function | Stops the cyclic transmission temporarily from the engineering tool. | $\bigcirc$ | $\bigcirc$ |  |
| Data link transfer function | Transfers the link data to another network at a time using parameters when more than one network module is connected to one programmable controller. | $\bigcirc$ | $\bigcirc$ |  |
| -Transient transmission |  |  |  |  |
| Transient transmission function | Allows communications between specific stations only when a communication request is made. <br> (Communications using link dedicated instructions or the engineering tool) | $\bigcirc$ | $\bigcirc$ | The LRDP and LWTP instructions cannot be used after replacement. Use the ZNRD, ZNWR, READ, or WRITE instruction instead. |
| Routing function | Performs the transient transmission to a station in another network number. | $\bigcirc$ | $\bigcirc$ |  |
| Group function | Performs the transient transmission to all the stations in a group with a single execution of an instruction. | $\bigcirc$ | $\bigcirc$ |  |
| -RAS function |  |  |  |  |
| Automatic on-line return function | Automatically returns a disconnected station to the network and restarts the data link when the station has recovered from an error. | $\bigcirc$ | $\bigcirc$ |  |
| Loopback function | Disconnects the erroneous or faulty station when an error or a fault such as a cable disconnection occurs and maintains the data link with the available stations. | $\bigcirc$ | $\bigcirc$ |  |
| Station separation function | Maintains the data link between the available stations even when some stations are down or powered off. | $\bigcirc$ | $\bigcirc$ |  |
| Diagnosis function | Checks the network line status and module settings. | $\bigcirc$ | $\bigcirc$ | In the RJ71LP21-25, use the "Network Diagnostics" function of the engineering tool. |
| Data link condition detection function | Detects faulty areas using the data in the link special relay and link special register. | $\bigcirc$ | $\bigcirc$ | In the RJ71LP21-25, use the "Network Diagnostics" function of the engineering tool. |
| Control station shift function | Maintains the data link with another normal station that serves as a sub-control station even if the control station goes down. | $\bigcirc$ | $\bigcirc$ |  |
| mothers |  |  |  |  |
| Multiplex transmission function | Allows a high-speed transmission using a duplex transmission path (toward and reverse loops). | $\bigcirc$ | $\triangle$ | The RJ71LP21-25 cannot operate as a master station that executes the multiplex transmission function. |
| Reserve station function | Reserves unconnected stations for future use. <br> By using this function, those stations are not detected as faulty stations and no communication error occurs. | $\bigcirc$ | $\bigcirc$ |  |

| Function |  | MELSEC-A series | MELSEC iQ-R series | Precautions |
| :---: | :---: | :---: | :---: | :---: |
|  |  | AJ71LP21 | RJ71LP21-25 <br> (MELSECNET/ 10 mode) |  |
| Station specific parameters | Used to rearrange the transmission range of each station (LB and LW) for a specific station. <br> Setting these parameters eliminates the need for changing programs even when the link device range has been extended during the operation. <br> This also avoids unnecessary transmission ranges. | $\bigcirc$ | $\times$ | Reassign the station specific parameters to the refresh parameters. ${ }^{*}$ |

*1 For details, refer to the following.
L]MELSEC iQ-R MELSECNET/H Network Module User's Manual (Application)

## AJ71QLP21 and RJ71LP21-25

$\bigcirc$ : Compatible/function available, $\triangle$ : Partly changed, $\times$ : Incompatible/function not available, 一: Not applicable

| Function |  | MELSEC-QnA series | MELSEC iQ-R series | Precautions |
| :---: | :---: | :---: | :---: | :---: |
|  |  | AJ71QLP21 | RJ71LP21-25 <br> (MELSECNET/ <br> 10 mode) |  |
| -Cyclic transmission |  |  |  |  |
| Communication with B/W | Allows data transmission to all the stations using the link relay and the link register. (Communications using B/W) | $\bigcirc$ | $\bigcirc$ |  |
| Communication with X/Y | Allows data communications between the I/O master station and one of the other stations (one-to-one communications). (Communications using $\mathrm{X} / \mathrm{Y}$ ) | $\bigcirc$ | $\bigcirc$ |  |
| Stopping/restarting cyclic transmission | Stops the cyclic transmission temporarily from the engineering tool. | $\bigcirc$ | $\bigcirc$ |  |
| Inter data link transfer function | Transfers the link data to another network at a time using parameters when more than one network module is connected to one programmable controller. | $\bigcirc$ | $\bigcirc$ |  |
| Direct access to the link device | Reads/writes link devices of the network module from/to a sequence program. | $\bigcirc$ | $\bigcirc$ |  |
| Increasing the send points by installing multiple modules of the same network No. | Increases the number of send points per station up to 8000 bytes by connecting multiple network modules of the same network number to one programmable controller. | $\bigcirc$ | $\bigcirc$ |  |
| Default values of network refresh parameters | Eliminates the need for setting parameters by using the default values of refresh parameters. | $\bigcirc$ | $\times$ |  |
| -Transient transmission |  |  |  |  |
| Transient transmission function | Allows communications between specific stations only when a communication request is made. (Communications using link dedicated instructions or the engineering tool) | $\bigcirc$ | $\bigcirc$ |  |
| Routing function | Performs the transient transmission to a station in another network number. | $\bigcirc$ | $\bigcirc$ |  |
| Group function | Performs the transient transmission to all the stations in a group with a single execution of an instruction. | $\bigcirc$ | $\bigcirc$ |  |
| Link dedicated instructions | Allows communications with other stations at desired timing. | $\bigcirc$ | $\bigcirc$ |  |
| Specifying default network | Processes the requests that cannot specify the destination network number. | $\bigcirc$ | $\times$ |  |
| Clock setting at stations in the network from peripheral devices | Configures the clock setting to the CPU modules on the network from the engineering tool. | $\bigcirc$ | $\bigcirc$ |  |
| -RAS function |  |  |  |  |
| Automatic recovery function | Automatically returns a disconnected station to the network and restarts the data link when the station has recovered from an error. | $\bigcirc$ | $\bigcirc$ |  |
| Loop back function | Disconnects the erroneous or faulty station when an error or a fault such as a cable disconnection occurs and maintains the data link with the available stations. | $\bigcirc$ | $\bigcirc$ |  |
| Station detachment function | Maintains the data link between the available stations even when some stations are down or powered off. | $\bigcirc$ | $\bigcirc$ |  |
| Transient transmission is possible when the programmable controller CPU is in fault | Allows users to check error details from the engineering tool via network when a stop error has occurred in a CPU module. | $\bigcirc$ | $\bigcirc$ | In the RJ71LP21-25, use the "Network Diagnostics" function of the engineering tool. |
| Confirming the transient transmission error detection time | Checks the time when the transient transmission was completed with an error, and the network number and the station number in which the error was detected. | $\bigcirc$ | $\bigcirc$ | In the RJ71LP21-25, use the "Network Diagnostics" function of the engineering tool. |

| Function |  | MELSEC-QnA series | MELSEC iQ-R series | Precautions |
| :---: | :---: | :---: | :---: | :---: |
|  |  | AJ71QLP21 | RJ71LP21-25 <br> (MELSECNET/ <br> 10 mode) |  |
| Diagnostic function | Checks the network line status and module settings. | $\bigcirc$ | $\bigcirc$ | In the RJ71LP21-25, use the "Network Diagnostics" function of the engineering tool. |
| Control station transfer function | Maintains the data link with another normal station that serves as a sub-control station even if the control station goes down. | $\bigcirc$ | $\bigcirc$ |  |
| ■Others |  |  |  |  |
| Multiplex transmission function | Allows a high-speed transmission using a duplex transmission path (toward and reverse loops). | $\bigcirc$ | $\triangle$ | The RJ71LP21-25 cannot operate as a master station that executes the multiplex transmission function. |
| Reserve station function | Reserves unconnected stations for future use. <br> By using this function, those stations are not detected as faulty stations and no communication error occurs. | $\bigcirc$ | $\bigcirc$ |  |
| Simplified network duplexing | Maintains the data link by switching the link data refresh target to the standby network if an error such as cable disconnection has occurred in the normal network. | $\bigcirc$ | $\times$ | The simplified duplex system is not available to the RJ71LP21-25. <br> Configure a single-network system. |
| SB/SW can be used as you like (user flags) | Sends the desired control information to all the stations using the user flags (SW01F0 to SW01F3) instead of the link device. | $\bigcirc$ | $\times$ | Change a program using the UFSET, UFRST, UFOUT instructions to a sequence program using the link relay and link register after replacement. |
| Station specific parameters | Used to rearrange the transmission range of each station (LB and LW) for a specific station. <br> Setting these parameters eliminates the need for changing programs even when the link device range has been extended during the operation. <br> This also avoids unnecessary transmission ranges. | $\bigcirc$ | $\times$ | Reassign the station specific parameters to the refresh parameters. ${ }^{* 1}$ |

[^17]
### 9.4 Precautions for Replacement

## CC-Link system master/local modules

## Dedicated instructions

The dedicated instructions differ between the MELSEC-A/QnA series and the MELSEC iQ-R series.
If the dedicated instruction is used in the MELSEC-A/QnA series program, the program needs to be corrected for MELSEC iQ-R series.

## I/O signals and buffer memory areas

The layouts of I/O signals and buffer memory areas differ between the MELSEC-A/QnA series and the MELSEC iQ-R series. If the I/O signals and buffer memory areas are used in the MELSEC-A/QnA series program, the program needs to be corrected for the MELSEC iQ-R series.

## Link special relay (SB) and link special register (SW)

The link special relay (SB)/link special register (SW) number assignments differ between the MELSEC-Q series and MELSEC iQ-R series modules. If the SB/SW is used in the MELSEC-A/QnA series program, the program needs to be corrected for the MELSEC iQ-R series.

## Peripheral connection module

If the AJ65BT-G4/AJ65BT-G4-S3 peripheral connection module is used, replace it with the AJ65BT-R2N CC-Link system RS232C interface module (MELSOFT connection setting).

## Processing time

The time such as sequence scan time or link refresh time differs between the MELSEC-A/QnA series and the MELSEC iQ-R series.
For details on the processing time, refer to the manual for the module used.

## Parameter registration to $E^{2}$ PROM

The MELSEC iQ-R series CC-Link system master/local module does not have E2PROM. Delete the sequence program corresponding to the parameter registration to $E^{2} P R O M$.

## MELSECNET/10 network modules

## Dedicated instructions

The dedicated instructions differ between the MELSEC-A/QnA series and the MELSEC iQ-R series.
If the dedicated instruction is used in the MELSEC-A/QnA series program, the program needs to be corrected for MELSEC iQ-R series.

## Processing time

The time such as sequence scan time or link refresh time differs between the MELSEC-A/QnA series and the MELSEC iQ-R series.
For details on the processing time, refer to the manual for the module used.

## Module parameters for normal stations

In the MELSEC iQ-R series, normal stations require network parameters.
Set them after replacement.

## Simplified duplex system

The MELSECNET/H simplified duplex system cannot be used in the MELSEC iQ-R series. Configure a single-network system after replacement.

## Remote I/O network

Remote I/O network is not available to the MELSEC iQ-R series. Consider replacing the existing system with a system on CCLink IE Field Network.

```
Point?
For details on these precautions, refer to the following.
LIMELSEC iQ-R Module Configuration Manual
LIMMELSEC iQ-R CC-Link System Master/Local Module User's Manual (Startup)
LIMELSEC iQ-R CC-Link System Master/Local Module User's Manual (Application)
LIMMELSEC iQ-R MELSECNET/H Network Module User's Manual (Startup)
LDMELSEC iQ-R MELSECNET/H Network Module User's Manual (Application)
```

## 10 INFORMATION MODULE REPLACEMENT

### 10.1 Alternative Model List

This section lists alternative models of the MELSEC iQ-R series information modules in accordance with the specifications and functions of the MELSEC-A/QnA series information modules.
Select models that best suit your application considering the scope of control of MELSEC-A/QnA series information modules currently used, as well as the system specifications and extensibility after replacement.

| Item | MELSEC-A/ QnA series | MELSEC iQ-R series | Specification difference |
| :---: | :---: | :---: | :---: |
| Computer link/serial communication | AJ71UC24 <br> AJ71QC24N | RJ71C24 | (1) External wiring: Changed <br> (2) Number of slots: Not changed <br> (3) Programs: I/O signals are changed and buffer memory addresses are changed. <br> (4) Specifications: Transmission speed is changed. <br> (5) Functions: Changed (No printer function and multidrop link function for the AJ71UC24/ No link dedicated instructions for the AJ71QC24N) |
|  | AJ71QC24N-R2 | RJ71C24-R2 | (1) External wiring: Changed <br> (2) Number of slots: Not changed <br> (3) Programs: I/O signals are changed and buffer memory addresses are changed. <br> (4) Specifications: Transmission speed is changed. <br> (5) Functions: Changed (No link dedicated instructions) |
|  | AJ71QC24N-R4 | RJ71C24-R4 | (1) External wiring: Changed <br> (2) Number of slots: Not changed <br> (3) Programs: I/O signals are changed and buffer memory addresses are changed. <br> (4) Specifications: Transmission speed is changed. <br> (5) Functions: Changed (No link dedicated instructions) |
| Ethernet interface | AJ71E71N3-T <br> AJ71QE71N3-T | RJ71EN71 | (1) External wiring: Not changed <br> (2) Number of slots: Not changed <br> (3) Programs: I/O signals are changed and buffer memory addresses are changed. <br> (4) Specifications: Not changed <br> (5) Functions: Changed (MC protocol 1E frame cannot be used.) |
|  | AJ71E71N-B5 <br> AJ71QE71N-B5 | RJ71EN71 | (1) External wiring: Changed (15-pin D-sub connector $\rightarrow$ RJ45) <br> (2) Number of slots: Not changed <br> (3) Programs: I/O signals are changed and buffer memory addresses are changed. <br> (4) Specifications: Changed (10BASE5 $\rightarrow$ 10BASE-T) <br> (5) Functions: Changed (MC protocol 1E frame cannot be used.) |
|  | AJ71E71N-B2 <br> AJ71QE71N-B2 | RJ71EN71 | (1) External wiring: Changed (BNC connector $\rightarrow$ RJ45) <br> (2) Number of slots: Not changed <br> (3) Programs: I/O signals are changed and buffer memory addresses are changed. <br> (4) Specifications: Changed (10BASE2 $\rightarrow$ 10BASE-T) <br> (5) Functions: Changed (MC protocol 1E frame cannot be used.) |
| Intelligent communication | AD51-S3 <br> AD51H-S3 | None | Consider replacing the existing system with a system on other networks. |
| Modem interface | A6TEL Q6TEL | None | Consider replacing the existing system with a system on other networks. |
| Memory card interface | AD59 | None | Consider replacing the current communication method with other communication method such as RS-232. <br> Consider replacing the memory card used with an SD memory card. |
| ID interface | AD35ID1 <br> AD35ID2 | None | Consider replacing the existing system with a system on other networks. |
| CRT/LCD controller module | AD57 <br> AD57S1 <br> AD58 | None | Consider replacing the module with a GOT. |

### 10.2 Specification Comparison Tables

## Serial communication modules

AJ71UC24/AJ71QC24N and RJ71C24

### 10.3 Function Comparison Tables

## Computer link/serial communication modules

AJ71UC24 and RJ71C24/RJ71C24-R2/RJ71C24-R4
$\bigcirc$ : Compatible/function available, $\triangle$ : Partly changed, $\times$ : Incompatible/function not available, 一: Not applicable

| Function |  |  | MELSEC-A/ QnA series | MELSEC iQ-R series | Precautions |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | AJ71UC24 | RJ71C24 <br> RJ71C24-R2 <br> RJ71C24-R4 |  |
| Communication using dedicated protocol ${ }^{* 1}$ | Device memory read/write | Reads/writes data on the programmable controller CPU from/ to the external devices. | $\bigcirc$ | $\triangle$ | Command to be used, accessible device ranges, and accessing to other stations are restricted. <br> The program on the external device needs to be changed. |
|  | On-demand | Transmits data from the programmable controller CPU to external devices. | $\bigcirc$ | $\triangle$ | Change it to a sequence program that uses the dedicated instruction (ONDEMAND). |
| Non-procedural communication | Data transmission <br> Programmable <br> controller $\rightarrow$ <br> External device | Transmits data from the programmable controller CPU to external devices. | $\bigcirc$ | $\triangle$ | Change it to a sequence program that uses the dedicated instruction (OUTPUT/INPUT). |
|  | Data reception <br> Programmable controller $\leftarrow$ External device | Receives data from external devices. | $\bigcirc$ | $\triangle$ |  |
| Bidirectional communication | Data transmission <br> Programmable controller $\rightarrow$ External device | Transmits data from the programmable controller CPU to external devices. | $\bigcirc$ | $\triangle$ | Change it to a sequence program that uses the dedicated instruction (BIDOUT/BIDIN). |
|  | Data reception <br> Programmable <br> controller $\leftarrow$ <br> External device | Receives data from external devices. | $\bigcirc$ | $\triangle$ |  |
| Transmission using printer function |  | Transmits messages (character strings) from the programmable controller CPU to the printer. | $\bigcirc$ | $\times$ | Change it to a sequence program that uses the dedicated instruction (PRR). <br> (Messages are transmitted by nonprocedural protocol using user frames.) |
| Multidrop link function |  | Data communication system via RS422/485 interface. Data can be exchanged between the master station and a local station or a remote station. Maximum eight local stations or remote stations can be connected to the master station. | $\bigcirc$ | $\times$ | The multidrop link function cannot be used. Consider replacing the existing system with a system on CC-Link. |
| Transmission control | DTR/DSR control, CD signal control | Controls data transmission/reception with external devices by RS-232 control signals. | $\bigcirc$ | $\bigcirc$ |  |
|  | DC code control | Sends/receives DC codes (including Xon/Xoff) to control data transmission/reception with external devices. | $\bigcirc$ | $\bigcirc$ |  |

[^18]AJ71QC24N/AJ71QC24N-R2/AJ71QC24N-R4 and RJ71C24/RJ71C24-R2/RJ71C24-R4
$\bigcirc$ : Compatible/function available, $\triangle$ : Partly changed, $\times$ : Incompatible/function not available, 一: Not applicable

| Function |  |  | MELSEC-A/QnA series | MELSEC iQ-R series | Precautions |
| :---: | :---: | :---: | :---: | :---: | :---: |

| Communication using dedicated protocol ${ }^{* 1}$ | Communications in ASCII mode | Communicates in dedicated protocol using ASCII data. <br> (Communications with QnA compatible 2C/3C/4C frame (format 1/ $2 / 3 / 4$ ), communications with A compatible 1C frame (format $1 / 2 / 3 / 4$ )) | $\bigcirc$ | $\bigcirc$ |  |
|  | Communications in binary mode | Communicates in dedicated protocol using binary data. <br> (Communications with QnA compatible 4C frame (format 5)) | $\bigcirc$ | $\bigcirc$ |  |
|  | Device memory read/write | Reads/writes data on the programmable controller CPU from/to the external devices. | $\bigcirc$ | $\bigcirc$ |  |
|  | Access to another station | Reads/writes data from/to programmable controller CPU of another station on the network system. | $\bigcirc$ | $\triangle$ | The program on the personal computer side may be required to change it depending on the network used. |
|  | On-demand | Transmits data from the programmable controller CPU to external devices. | $\bigcirc$ | $\bigcirc$ |  |
| Non-procedural protocol communication | Data transmission/ reception <br> Programmable controller $\leftrightarrow$ External device | Transmits/receives data between the programmable controller CPU and external devices. | $\bigcirc$ | $\bigcirc$ |  |
|  | Data transmission/ reception in user frames | Transmits/receives data using the data (user frames) registered to the serial communication module. | $\bigcirc$ | $\bigcirc$ |  |
|  | Data transmission/ reception by ASCII binary conversion | Converts binary data to ASCII data to transmit the data. Received ASCII data is also converted to binary data. | $\bigcirc$ | $\bigcirc$ |  |
| Bidirectional protocol communication | Data transmission/ reception Programmable controller $\leftrightarrow$ External device | Transmits/receives data between the programmable controller CPU and external devices. | $\bigcirc$ | $\bigcirc$ |  |
|  | Data transmission/ reception by ASCII binary conversion | Converts binary data to ASCII data to transmit the data. Received ASCII data is also converted to binary data. | $\bigcirc$ | $\bigcirc$ |  |
| Communication by dedicated link instruction (SEND, RECV, READ, RITE, REQ) |  | Transmits/receives data with programmable controller CPU of another station on a multidrop connection by link dedicated instructions. | $\bigcirc$ | $\times$ | In the MELSEC iQ-R series, the function that communicates data with programmable controller CPU of another station on a multidrop connection by link dedicated instructions is not supported. Communication method needs to be changed. <br> Delete data communication program by link dedicated instruction. |
| Transmission control | DTR/DSR control, RS/CS control, CD signal control | Controls data transmission/reception with external devices by RS-232 control signals. | $\bigcirc$ | $\bigcirc$ |  |
|  | DC code control | Sends/receives DC codes (including Xon/Xoff) to control data transmission/ reception with external devices. | $\bigcirc$ | $\bigcirc$ |  |

[^19]
## Ethernet interface modules

| $\bigcirc$ : Compatible/function available, $\triangle$ : Partly changed, $\times$ : Incompatible/function not available, 一: Not applicable |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Function |  | MELSEC-A/ <br> QnA series | MELSEC iQ-R series | Precautions |
|  |  | AJ71E71N3-T AJ71E71N-B5 AJ71E71N-B2 | RJ71EN71 (Qcompatible Ethernet) |  |
| Initial processing | Enables data communications with an external device. | $\bigcirc$ | $\triangle$ | Use module parameters. |
| Open processing | Connects the communication line to enable data communications with external devices. | $\bigcirc$ | $\triangle$ | Change it to a sequence program that uses the dedicated instruction (OPEN/CLOSE). |
| Communications using fixed buffer <br> (procedural/nonprocedural) | Sends/receives any data between the programmable controller CPU and external devices using the fixed buffer on the Ethernet interface module. | $\bigcirc$ | $\triangle$ | Change it to a sequence program that uses the dedicated instruction (BUFSND/BUFRCV) |
| Communications using random access buffer | Reads/writes data from multiple connected devices to the random access buffer on the Ethernet interface module. | $\bigcirc$ | $\bigcirc$ |  |
| Read/write communications of programmable controller CPU internal data | Reads/writes programmable controller CPU data from/to the external devices. | $\bigcirc$ | $\triangle$ | Some of the commands and device ranges are restricted. |
| Broadcast communication | Sends/receives data to all external devices on the same Ethernet as the Ethernet interface module by UDP/IP-based data communications. (Broadcast) | $\bigcirc$ | $\bigcirc$ |  |
| Communications while the programmable controller CPU is stopped | Continues data communications even when the programmable controller CPU is in the stop state. (during Passive open processing) | $\bigcirc$ | $\triangle$ | Use module parameters. |
| Router relay function | Communicates data through a router and a gateway. | $\bigcirc$ | $\triangle$ | Use module parameters. |
| Existence check of external device | Checks whether a connected device is normally operating after a connection is established (open processing). | $\bigcirc$ | $\triangle$ | Change it to a sequence program that uses the dedicated instruction (OPEN). <br> Only KeepAlive is available for TCP/IP. |
| Communications using pairing open | Opens connection with the connection for reception and connection for transmission as a single pair. (For communications using a fixed buffer) | $\bigcirc$ | $\triangle$ | Change it to a sequence program that uses the dedicated instruction (OPEN). |
| Timer setting value units for data exchange | Sets the unit ( $500 \mathrm{~ms} / 2 \mathrm{~s}$ ) of each time value. | $\bigcirc$ | $\triangle$ | Use module parameters. Each timer value can be set in increments of 100 ms . |

## AJ71QE71N3-T/AJ71QE71N-B5/AJ71QE71N-B2 and RJ71EN71

$\bigcirc$ : Compatible/function available, $\triangle$ : Partly changed, $\times$ : Incompatible/function not available, 一: Not applicable

| Function |  | MELSEC-A/ QnA series | MELSEC iQ-R series | Precautions |
| :---: | :---: | :---: | :---: | :---: |
|  |  | AJ71QE71N3-T AJ71QE71N-B5 AJ71QE71N-B2 | RJ71EN71 (Q- <br> compatible Ethernet) |  |
| Initial processing (sequence program/network parameters) | Enables data communications with an external device. | $\bigcirc$ | $\triangle$ | Use module parameters. |
| Open processing | Connects the communication line to enable data communications with external devices. | $\bigcirc$ | $\bigcirc$ |  |
| Communications using fixed buffer (procedural/nonprocedural) | Sends/receives any data between the programmable controller CPU and external devices using the fixed buffer on the Ethernet interface module. | $\bigcirc$ | $\triangle$ |  |
| Communications using random access buffer | Reads/writes data from multiple connected devices to the random access buffer on the Ethernet interface module. | $\bigcirc$ | $\bigcirc$ |  |
| Read/write communications of programmable controller CPU internal data | Reads/writes data on the programmable controller CPU from/to the external devices. | $\bigcirc$ | $\triangle$ | Some of the commands and device ranges are restricted. |
| Communications using data link instructions | Reads/writes data on the programmable controller CPU in other stations over Ethernet using data link instructions. | $\bigcirc$ | $\bigcirc$ |  |
| File transfer (FTP server functions) | Reads/writes data in files from connected devices using an FTP command. | $\bigcirc$ | $\bigcirc$ |  |
| Broadcast communication | Sends/receives data to all external devices on the same Ethernet as the Ethernet interface module by UDP/IP-based data communications. (Broadcast) | $\bigcirc$ | $\bigcirc$ |  |
| Communications while the programmable controller CPU is stopped | Continues data communications even when the programmable controller CPU is in the stop state. (during Passive open processing) | $\bigcirc$ | $\triangle$ | Use module parameters. |
| MELSECNET/H, MELSECNET/ <br> 10 relay exchange | Communicates data over multiple network systems where Ethernet, MELSECNET/H, and MELSECNET/10 exist together or network systems that relay multiple Ethernet networks. | $\bigcirc$ | $\triangle$ | Use module parameters. |
| Router relay function | Communicates data through a router and a gateway. | $\bigcirc$ | $\bigcirc$ |  |
| Existence check of external device | Checks whether a connected device is normally operating after a connection is established (open processing). | $\bigcirc$ | $\bigcirc$ |  |
| Communications using pairing open | Opens connection with the connection for reception and connection for transmission as a single pair. (For communications using a fixed buffer) | $\bigcirc$ | $\triangle$ | For the MELSEC iQ-R series, connection No. 8 cannot be used. |
| Parameter registration to $E^{2}$ PROM | Registers parameters to $\mathrm{E}^{2} \mathrm{PROM}$. | $\bigcirc$ | $\triangle$ | For the MELSEC iQ-R series, $E^{2} P R O M$ is not supported. Register the parameters to the CPU. |

### 10.4 Precautions for Replacement

## Computer link/serial communication modules

## I/O signals and buffer memory areas

The layouts of I/O signals and buffer memory areas differ between the MELSEC-A/QnA series and the MELSEC iQ-R series. If the I/O signals and buffer memory areas are used in the MELSEC-A/QnA series program, the program needs to be corrected for the MELSEC iQ-R series.

## Send area and receive area in the refresh setting

In MELSEC iQ-R series, the range of the send area and the receive area cannot be specified in the refresh setting. All the send and receive areas listed below are refreshed.

- Send area (CH1): Buffer memory address 1024 to 1535 (400H to 5FFH)
- Receive area (CH1): Buffer memory address 1536 to 2047 (600H to 7FFH)
- Send area (CH2): Buffer memory address 2048 to 2559 (800H to 9FFH)
- Receive area (CH2): Buffer memory address 2560 to 3071 (AOOH to BFFH)

## Processing time

The time such as the processing time for data communications differ between the MELSEC-A/QnA series and the MELSEC Q-R series.

For details on the processing time, refer to the manual for the module used.

## Ethernet interface modules

## Dedicated instruction

The dedicated instructions differ between the MELSEC-A/QnA series and the MELSEC iQ-R series.
If the dedicated instruction is used in the MELSEC-A/QnA series program, the program needs to be corrected for MELSEC iQ-R series.

## I/O signals and buffer memory areas

The layouts of I/O signals and buffer memory areas differ between the MELSEC-A/QnA series and the MELSEC iQ-R series. If the l/O signals and buffer memory areas are used in the MELSEC-A/QnA series program, the program needs to be corrected for the MELSEC iQ-R series.

## Parameter registration to $\mathrm{E}^{2}$ PROM

$E^{2} P R O M$ is not supported for the Ethernet interface module in the MELSEC iQ-R series. Delete the sequence program corresponding to the parameter registration to $E^{2} P R O M$.

## Initial processing/End processing

Both the initial processing/End processing by the sequence program and the initial processing by the network parameter cannot be used together.

Delete the processing by the sequence program when using the network parameter.

## Open processing/close processing

Do not use both the open processing/close processing by the I/O signals and the processing by the dedicated instruction
(OPEN/CLOSE) on the same connection.

## Passive open processing

For the MELSEC iQ-R series, an open request cannot be canceled before the open processing is completed once Passive open processing is executed. Execute close processing after the open processing is completed.

## Communications using a fixed buffer

Do not use both communications using a fixed buffer by the I/O signals and the communications by the dedicated instruction (BUFSND/BUFRCV/BUFRCVS) on the same connection.

## Processing time

The time such as the processing time for data communications differ between the MELSEC-A/QnA series and the MELSEC iQ-R series.

For details on the processing time, refer to the manual for the module used.

## Replacement from 10BASE5/10BASE2 to 100BASE-TX/10BASE-T

Convert 10BASE5/10BASE2 into 10BASE-T/100BASE-TX.
Use a media converter and convert the interface from 10BASE5 or 10BASE2 to 10BASE-T.
For details, refer to the following.
$\square \square$ Production discontinuation of MELSEC-Q series Ethernet interface module/FL-net (OPCN-2) interface module (FA-A0190)

## SLMP (MC protocol) communication setting

Select "SLMP Connection Module" for the MELSEC iQ-R series.

## Random access buffer communication setting

Select the connection target module, and then select "Random Access Buffer" in "Communication Method" for the MELSEC iQ-R series.

## Broadcast setting

Select the connection target module, and then select "Broadcast Send" or "Broadcast Receive" in "Communication Method" for the MELSEC iQ-R series.

## Unused connection setting

Set "MELSOFT Connection Module" in the unused connection number for the MELSEC iQ-R series.

## TCPIIP connection module setting

Setting the connected device automatically determines the protocol in the MELSEC $i Q-R$ series.

## Alive check setting

For the MELSEC iQ-R series, set whether to perform an alive check in "External Device Configuration" for each connection. Only the KeepAlive command can be used for the TCP/IP alive check.

## Online change setting

For the MELSEC iQ-R series, enable the online change function in "Enable/Disable Online Change" under "Own Node Settings" of "Basic Settings" when the SLMP communications are performed. When the FTP server function is used, enable the function in "Allow Online Change" under "FTP Server Settings" of "Application Settings".

## Send frame setting

Only "Ethernet (V2.0)" frame can be used for the MELSEC iQ-R series. "IEEE 802.3" frame can be used for received data only.

## Gateway parameter settings

Set "Subnet Mask" or "Default Gateway" under "Own Node Settings" of "Basic Settings" and set "Gateway Information" under "Gateway Parameter Settings" of "Application Settings" for the MELSEC iQ-R series.

L]MELSEC iQ-R Module Configuration Manual

LIMMELSEC iQ-R Ethernet User's Manual (Application)

## 11 PROJECT REPLACEMENT

This section describes how to replace the MELSEC-A/QnA series project with the MELSEC iQ-R series project. There are two methods for project replacement: one method uses MELSEC-A/QnA -> MELSEC iQ-R Conversion Support Tool and the other method uses GX Developer, GX Works2, and GX Works3.

### 11.1 Replacement Using MELSEC-A/QnA -> MELSEC iQ-R Conversion Support Tool

## MELSEC-A/QnA -> MELSEC iQ-R Conversion Support Tool

This tool converts a GX Developer format project into a GX Works3 format project. This tool also can output support information which is necessary to correct the converted project.

| Icon | Description |
| :--- | :--- |
| GX Developer format project |  |
| GX Works2 format project |  |
| GX Works3 format project |  |

[^20]
## Instant check of where to correct

If a special relay/special register area, an instruction, and a special function module which are not available for an RCPU are used in a program, the program needs to be corrected after converting a project.

MELSEC-A/QnA -> MELSEC iQ-R Conversion Support Tool provides information of the parts to be corrected in two formats. By referring the information, the program can be corrected efficiently.

## Outputting a review information list

Information such as the number of items to be corrected and corrective actions is output in HTML format.
For a special function module, information of a recommended module to replace is also displayed.

## Inserting a line statement

A line statement is inserted on a part to be corrected in a program.
On the line statement, information before and after conversion and an alert are displayed.

## System configuration

The following figure shows the system configuration of MELSEC-A/QnA -> MELSEC iQ-R Conversion Support Tool for conversion.

MELSEC-A/QnA -> MELSEC iQ-R Conversion Support Tool, GX Developer, GX Works2, and GX Works3 are required.

## Software versions

The following table lists the software versions which are necessary for converting a project.

| Software | Version |
| :--- | :--- |
| MELSEC-A/QnA -> MELSEC iQ-R Conversion Support Tool | No restrictions |
| GX Developer | Version 8.503 Z or later |
| GX Works2 | Version 1.590 Q or later |
| GX Works3 | Version 1.066 U or later |

## Convertible projects

GX Developer format projects for the following CPU modules can be converted.

| Series | Type | Program language | Label setting |
| :--- | :--- | :--- | :--- | :--- |
| QnACPU | Q2A, Q2AS(H), Q2AS1, Q2AS(H)S1, Q3A, Q4A, Q4AR | Ladder diagram ${ }^{* 1}$ | Do not use label |
| ACPU | A0J2H, A1FX, A1S, A1SJ, A1SH, A1SJH, A1N, A2C, A2CJ, A2N(S1), A2S, <br> A2SH, A3N, A2A(S1), A3A, A2U(S1), A2US(S1), A2USH-S1, A3U, A4U |  |  |
| CNC(M6/M7) | Q4A |  |  |

*1 When using the SFC instruction in a ladder program, instructions other than the END instruction are deleted in a converted program.

## Point ${ }^{\rho}$

A project including an SFC program cannot be converted.
Convert the project after deleting the SFC program.

## Function list

The following table lists the functions of MELSEC-A/QnA -> MELSEC iQ-R Conversion Support Tool.

| Function | Description |
| :--- | :--- |
| Converting a project | Converts a GX Developer format project into a GX Works3 format project automatically. |
| Outputting a review information <br> list | Outputs a list of the following information as an HTML file when converting a project: a special relay/special register area, an <br> instruction, and a special function module which are not available for an RCPU. |
| Embedding conversion <br> information on a line statement | Embeds the following information on a line statement of a converted project (program) when converting a project: a special <br> relay/special register area, an instruction, and a special function module which are not available for an RCPU. |

## Obtaining MELSEC-A/QnA->MELSEC iQ-R Conversion Support Tool

Please consult your local Mitsubishi Electric representative.

## Installation and uninstallation

For the installation/uninstallation procedure of MELSEC-A/QnA -> MELSEC iQ-R Conversion Support Tool, refer to the following.
[]MMELSEC-A/QnA -> MELSEC iQ-R Conversion Support Tool Installation Instructions (BCN-P5999-1284)
The above manual is stored in the zip file where the installer is located.

## Converting a project

This section describes the operations to convert a GX Developer format project into a GX Works3 format project.

## Precautions

When a program exists after the END instruction in a conversion source program, the program after the END instruction will be deleted at conversion.

## Operating procedure

1. Specify a conversion source GX Developer format project.
2. When a special function module is used in the source project, select the checkbox of "Special function module exists" and set the following items:

- Special function module type
- Special function module type name
- Start XY No. (HEX)

## Point 8

- In an input screen for special function module information, data can be copied and pasted.
- In the following case, review information is embedded on a line statement of a converted program: there is an instruction using a buffer memory address or an input/output signal of the special function module which was set in the step 2 in the source project. Also, the information is output as a list.
- If special function module information is not set in the step 2, a program is not detected as the one to be reviewed even when a special function module is used in the source project.

3. Select the checkbox of "ASC instruction is converted into \$MOV instruction." as necessary.
When converting the ASC instruction into the \$MOV instruction, the range of a device that the instruction uses increases by one word. Review a program when the device overlaps.
4. Specify a converted GX Works3 format project and an output folder for a review information list.

- The converted GX Works3 format project is saved as a single file format.
- A folder with the same name as that of the converted GX Works3 format project file is created in the output folder for a review information list.

5. Check the settings, and click the [Execute] button.
6. Select the checkboxes of "Start the project after conversion" and "Start the review information list" as necessary.
7. Click the [Completed] button.

## Precautions

- A converted model is R120CPU. Therefore, change the model to match customer use.
- The number of displayed contacts of a program is not applied from a GX Developer format project. Change the number as necessary in GX Works3.
For the method to change the module type and the number of displayed contacts, refer to the following.
L]GX Works3 Operating Manual
- The $S(P) . / Z(P) . / G(P) \cdot / J(P)$. instruction of a QnACPU may not be converted. Check an unconverted instruction in a review information list and a line statement.

If MELSEC-A/QnA -> MELSEC iQ-R Conversion Support Tool is forcibly terminated or an error occurs in the tool while converting a project, a process of GX Works3 converting the project in the background may remain. In this case, terminate the process of GX Works3 by any of the following methods:

- Log off the personal computer.
- Terminate the process of "GXW3.exe" in the task manager.

## Review information list

Information regarding a special relay/special register area, an instruction, and a special function module which are not available for an RCPU is output in an HTML file.

## Operating procedure

1. Right-click "Index.htm" stored in (output folder for review information list)(folder with the converted project name), and select [Open with] $\Rightarrow$ [(Web browser)].
The conversion result of all the programs is displayed.
2. Click each link displayed in the "Display the Conversion Result" column to check the detail.

Point ${ }^{8}$
By checking the "Number of Detections" column, each number of unconverted special relay/special resister areas, instructions, and programs for special function modules to be reviewed can be confirmed.

## Detail screen

The following figures are display examples of a review information list.
Ex.
Unconverted instruction (in order of step No.)

A search key is displayed on a review information list. In a converted GX Works3 format project, by searching the search key with the character string search function, the cursor can jump to the target line statement.

Ex.
Program for special function modules necessary in review (in alphabetical order of special function module name)
Program for Special Function Modules Necessary in Review (In Alphabetical Order of Module Name) Back to

## [Program Name: SUB1]

"Recommended Module to Replace" is displayed in a detail screen of "Program for Special Function Modules Necessary in Review".
This handbook appears by clicking the module name, and shows a comparison table of recommended modules.

## Line statement

Information regarding a special relay/special register area, an instruction, and a special function module which are not available for an RCPU is embedded on a line statement of a relevant ladder block.
A line statement type is set to "In Peripheral". ("*" is added at the beginning of the character strings.)
For the operation method of a statement, refer to the following.
LDGX Works3 Operating Manual

## Point 8

A search key (example: \#000000) for each step is added on a line statement.
This search key is also displayed on a review information list, and it is possible to search mutually with this key.

## Operating procedure

1. Open a converted $G X$ Works 3 format project.

## Point ${ }^{\ominus}$

A converted project is stored in the folder specified in the following.
$\longmapsto$ Page 299 Converting a project
2. Select [View] $\Rightarrow$ [Statement Display].
3. Check an embedded line statement.

## Checking conversion information of special relay/special resister area and instruction

Special relay/special resister areas and instructions which are not available in an RCPU are converted as follows.
Special relay areas/special register areas: SM4095/SD4095
Instructions: OUT SM4095

## Ex.

Special relay areas/special register areas

(1) Search key
(2) Conversion information

## Point $\rho$

By searching a search key in a detail screen of a review information list, the cursor can jump to the review information for the program.

## Checking conversion information of a special function module

Buffer memory addresses and input/output signals of a special function module are not converted.
Therefore, a statement that shows a necessity of reviewing is inserted on a part in which an instruction to access a special function module (FROM, DFRO, TO, DTO) and input/output signal exist.

(3)
(1) Search key
(2) Alert
(3) Model name of a special function module (start and end input/output numbers)

## Point?

By searching a search key in a detail screen of a review information list, the cursor can jump to the review information for the program.

### 11.2 Replacement Using GX Developer/GX Works2/GX Works3

To replace projects by this method, use GX Developer Version 8.62Q or later and GX Works2 Version 1.05F or later. To read SFC programs, use GX Works2 Version 1.535 H or later and GX Works3 Version 1.020 W or later.

## Project replacement flow

1. Operation with GX Developer

Change the PLC type of the ACPU project (in GX Developer format) (A/QnACPU $\rightarrow$ Q26UDEHCPU), and save it as the QCPU project (in GX Developer format).
2. Operation with GX Works2

Read the QCPU project (in GX Developer format), and save it as the QCPU project (in GX Works2 format).
3. Operation with $G X$ Works3

Read the QCPU project (in GX Works2 format), and convert it into the RCPU project (in GX Works3 format).

## Operation method

- Operation with GX Developer

MELSOFT series GX Developer (Unset project) - [LD(Ed

| $\square$ | Project | Edit | Find/Replace | Convert | View | Onl |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| [ | New project ... |  |  |  | $\mathrm{Ctrl}+\mathrm{N}$ |  |
|  |  | en proj | ect ... |  | Ctrl +O |  |
|  | Close project |  |  |  |  |  |
| -1 <br> F5 | Save |  |  |  | Ctrl + S |  |
| 아N | Save as ... |  |  |  |  |  |
|  | Delete project ... |  |  |  |  |  |

| :---: | :---: | :---: |
|  | Open project ... | Ctrl +O |
|  | Close project |  |
| -1 F5 | Save | Ctrl + S |
| 탕 | Save as ... |  |

1. Select [Project] $\Leftrightarrow$ [Change PLC Type].
2. Select "QCPU(Qmode)" and "Q26UDEHCPU", and click the [OK] button.
3. The following message appears. Read the message, and click the [Yes] button.
4. Select [Project] $\Rightarrow$ [Save as] to save the project.

- Operation with GX Works2

- Operation with GX Works3

間 MELSOFT GX Works3 (Untitled Project)

10. The following message appears. Read the message, and click the [OK] button.
11. The GX Works2 format project is opened in GX Works3. The changes in project data are displayed in the "Output" window. Change the parameters and program (devices and instructions used) as required.
12. Select [Project] $\Rightarrow$ [Change Module Type/Operation Mode], and select a model to be actually used. After the project is replaced, the model is automatically set to R120CPU. The user needs to set the model actually used.

### 11.3 Instruction Replacement

After the project is replaced, instructions that are not supported by the RCPU are converted into those using SM4095/ SD4095. For details on the converted instructions, refer to the following.
$\square]$ Transition from MELSEC-A/QnA (Large Type) Series to Q Series Handbook (Fundamentals)
LDMELSEC-Q Series to MELSEC iQ-R Series Migration Guide

### 11.4 Parameter Replacement

MELSEC-A/QnA series uses GX Developer, but MELSEC iQ-R series uses GX Works3. Therefore, the user needs to review and re-set parameters.
For how to set parameters for the RCPU, refer to the following.
LIMMELSEC iQ-R CPU Module User's Manual (Startup)

### 11.5 Special Relay and Special Register Replacement

Devices used as special relay and special register differ between the A/QnACPU and the RCPU.
The special relay and special register areas of the A/QnACPU are automatically converted into those of the RCPU when the project is replaced. At this time, the special relay and special register areas that are not supported by the RCPU are converted into SM4095/SD4095.
Search SM4095/SD4095, and modify the program as required.
The following table lists the special relay and special register areas of each CPU module.

| Category | ACPU | QnACPU | QCPU | RCPU |
| :--- | :--- | :--- | :--- | :--- |
| Special relay | M9000 to M9255 | SM0 to SM2047*1 | SM0 to SM2047*1 | SM0 to SM4096*1 |
| Special register | D9000 to D9255 | SD0 to SD2047 ${ }^{* 1}$ | SD0 to SD2047 ${ }^{* 1}$ | SD0 to SD4096*1 |

[^21]
### 11.6 Precautions for Replacement

## Timer

The setting method, setting range, and processing method of the timer differ between the A/QnACPU and the RCPU. Modify the program as required.

| Category |  | ACPU | QnACPU | RCPU |
| :---: | :---: | :---: | :---: | :---: |
| Low-speed timer | Measurement unit | Fixed to 100 ms | In the range of 10 to 1000 ms (Default: 100ms) | In the range of 1 to 1000 ms (Default: 100ms) |
|  | Specification method | [OUT Tn Kn] | [OUT Tn Kn] |  |
| High-speed timer | Measurement unit | Fixed to 10 ms | In the range of 0.1 to 100 ms (Default: 10ms) | In the range of 0.01 to 100 ms (Default: 10ms) |
|  | Specification method | [OUT Tn Kn] | [OUT H Tn Kn] |  |
| Retentive timer | Measurement unit | Fixed to 100 ms | In the range of 10 to 1000 ms (Default: 100ms) | In the range of 1 to 1000 ms (Default: 100ms) |
|  | Specification method | [OUT Tn Kn] | [OUT STn Kn] |  |
| High-speed retentive timer | Measurement unit | None | In the range of 0.1 to 100 ms (Default: 10ms) | In the range of 0.01 to 100 ms (Default: 10ms) |
|  | Specification method |  | [OUT H STn Kn] |  |
| Setting range |  | 1 to 32767 |  | 0 to 32767 |
| Processing when 0 is set |  | Infinite (no timeout) | Instant-on |  |
| Update processing of the current value, on/off processing of the contact |  | During the END processing | At execution of [OUT Tn Kn/OUT H Tn Kn] |  |

## Counter

The processing method of the counter differs between the ACPU and the RCPU. Modify the program as required.

| Category | ACPU | QnACPU | RCPU |
| :--- | :--- | :--- | :--- |
| Specification method | [OUT Cn Kn] | At execution of [OUT Cn Kn] |  |
| Update processing of the current <br> value, <br> on/off processing of the contact | During the END processing |  |  |

## Display instructions

The RCPU does not support display instructions. Consider replacing them as described below.

| Category | ACPU | QnACPU | RCPU |
| :--- | :--- | :--- | :--- |
| PR | When M9049 is off, the characters <br> before 00 H are output. <br> When M9049 is on, 16 characters <br> are output. | When SM701 is off, the characters <br> before 00 H are output. <br> When SM701 is on, 16 characters <br> are output. | Consider replacing the instructions <br> with a display unit or a touch panel. |
| PRC | A comment (16 characters) is output. | When SM701 is off, a comment (32 <br> characters) is output. <br> When SM701 is on, a comment (first <br> 16 characters) is output. |  |

## Index register

The index register area of the ACPU is " $Z, Z 1$ to $\mathrm{Z} 6, \mathrm{~V}, \mathrm{~V} 1$ to V 6 ", but the area of the RCPU is " Z 0 to Z 20 ". (The device " V " is used as the edge relay in the RCPU.) The index register is replaced as follows when the project is converted.

| Category | ACPU | RCPU |
| :--- | :--- | :--- |
| Index register | Z | Z0 |
|  | Z1 to Z6 | Z1 to Z6 |
|  | V | Z7 |
|  | V1 to V6 | Z8 to Z13 |

When the value other than $Z / Z 1$ is used as an index modified device in the contact instructions of the timer and the counter in the ACPU, it is converted into SM4095. Modify the program.

## Index register 32-bit specification

For the index register 32-bit specification, the ACPU uses $Z$ for the last 16 bits and $V$, the same area number as $Z$, for the first 16 bits.

However, the RCPU uses LZ (long index register) or ZZ (using two points of index register).
When the index register 32-bit specification is used in the ACPU, modify the program.

## File register

The storage location of the file register differs between the A/QnACPU and the RCPU.

| Category | ACPU | QnACPU | RCPU |
| :--- | :--- | :--- | :--- |
| Storage location | Memory cassette | Memory card <br> (Two cards, four drives maximum) | Device/label memory, <br> extended SRAM cassette |
| Maximum number of points | Depends on the memory cassette <br> used. | 1018K points $\times 2$ <br> (when two 2M memory cards are <br> used) | R00/R01/R02CPU: 98304 points, <br> R04/R08/R16CPU: Calculated by a <br> formula. ${ }^{*}$ |
| Number of points per block | 8K points | 32K points | 32K points |

*1 The maximum value is $[\alpha+\beta]$.
$\alpha$ : <Capacity of the R**CPU> (R04CPU: 160K words, R08CPU: 544 K words, R16CPU: 800K words)
$\beta$ : Capacity of the extended SRAM cassette
The value must be in the following range.
File register file storage area $\leq[\alpha+\beta]$

## Dedicated instructions

The LEDA, LEDB, LEDC, SUB, and LEDR instructions used in the AnA/AnUCPU are converted into the same format as basic instructions and application instructions in the RCPU.
However, the dedicated instructions that are not supported by the RCPU are converted into SM4095. Modify the program.

| Category | RCPU/QnACPU | AnACPU/AnUCPU |
| :---: | :---: | :---: |
| Instruction | $\left\|\begin{array}{l} \text { Command } \\ \hline \end{array}\right\| \begin{array}{\|l\|l\|l\|l\|} \hline \text { Instruction } & \mathbf{S} & \mathbf{D} & \mathbf{n} \\ \hline & & \\ \hline \end{array}$ | $\mathrm{S}, \mathrm{D}$, and n indicate the data used in instructions |

## Main program and subprograms

A main program and its subprograms in the ACPU are converted into separate programs when the project is converted.

## Boot operation (Writing programs to ROM)

The program memory of the RCPU is flash ROM, and therefore the boot operation is not required.

## REVISIONS

*The manual number is given on the bottom left of the back cover.

| Revision date | *Manual number | Description |
| :--- | :--- | :--- |
| December 2019 | L(NA)08666ENG-A | First edition |
| September 2020 | L(NA)08666ENG-B | ■Added models <br> RJ71LP21-25, MELSEC-A/QnA -> MELSEC iQ-R Conversion Support Tool <br> ■Added part <br> Section 11.1 <br> ■Modified parts <br> Chapter 9, Section 10.1, 11.1 $\rightarrow 11.2,11.2 \rightarrow 11.3,11.3 \rightarrow 11.4,11.4 \rightarrow 11.5,11.5 ~$ 11.6 |

## WARRANTY

Please confirm the following product warranty details before using this product.

## 1. Gratis Warranty Term and Gratis Warranty Range

If any faults or defects (hereinafter "Failure") found to be the responsibility of Mitsubishi occurs during use of the product within the gratis warranty term, the product shall be repaired at no cost via the sales representative or Mitsubishi Service Company.
However, if repairs are required onsite at domestic or overseas location, expenses to send an engineer will be solely at the customer's discretion. Mitsubishi shall not be held responsible for any re-commissioning, maintenance, or testing on-site that involves replacement of the failed module.
[Gratis Warranty Term]
The gratis warranty term of the product shall be for one year after the date of purchase or delivery to a designated place. Note that after manufacture and shipment from Mitsubishi, the maximum distribution period shall be six (6) months, and the longest gratis warranty term after manufacturing shall be eighteen (18) months. The gratis warranty term of repair parts shall not exceed the gratis warranty term before repairs.
[Gratis Warranty Range]
(1) The range shall be limited to normal use within the usage state, usage methods and usage environment, etc., which follow the conditions and precautions, etc., given in the instruction manual, user's manual and caution labels on the product.
(2) Even within the gratis warranty term, repairs shall be charged for in the following cases.

1. Failure occurring from inappropriate storage or handling, carelessness or negligence by the user. Failure caused by the user's hardware or software design.
2. Failure caused by unapproved modifications, etc., to the product by the user.
3. When the Mitsubishi product is assembled into a user's device, Failure that could have been avoided if functions or structures, judged as necessary in the legal safety measures the user's device is subject to or as necessary by industry standards, had been provided.
4. Failure that could have been avoided if consumable parts (battery, backlight, fuse, etc.) designated in the instruction manual had been correctly serviced or replaced.
5. Failure caused by external irresistible forces such as fires or abnormal voltages, and Failure caused by force majeure such as earthquakes, lightning, wind and water damage.
6. Failure caused by reasons unpredictable by scientific technology standards at time of shipment from Mitsubishi.
7. Any other failure found not to be the responsibility of Mitsubishi or that admitted not to be so by the user.
8. Onerous repair term after discontinuation of production
(1) Mitsubishi shall accept onerous product repairs for seven (7) years after production of the product is discontinued.

Discontinuation of production shall be notified with Mitsubishi Technical Bulletins, etc.
(2) Product supply (including repair parts) is not available after production is discontinued.
3. Overseas service

Overseas, repairs shall be accepted by Mitsubishi's local overseas FA Center. Note that the repair conditions at each FA Center may differ.
4. Exclusion of loss in opportunity and secondary loss from warranty liability

Regardless of the gratis warranty term, Mitsubishi shall not be liable for compensation to:
(1) Damages caused by any cause found not to be the responsibility of Mitsubishi.
(2) Loss in opportunity, lost profits incurred to the user by Failures of Mitsubishi products.
(3) Special damages and secondary damages whether foreseeable or not, compensation for accidents, and compensation for damages to products other than Mitsubishi products.
(4) Replacement by the user, maintenance of on-site equipment, start-up test run and other tasks.

## 5. Changes in product specifications

The specifications given in the catalogs, manuals or technical documents are subject to change without prior notice.

## TRADEMARKS

Microsoft and Windows are either registered trademarks or trademarks of Microsoft Corporation in the United States and/or other countries.
Unicode is either a registered trademark or a trademark of Unicode, Inc. in the United States and other countries.
The company names, system names and product names mentioned in this manual are either registered trademarks or trademarks of their respective companies.
In some cases, trademark symbols such as ${ }^{, T \mathrm{M},}$ or ${ }^{\text {'®1 }}$ are not specified in this manual.
