

**Automating the World** 

FACTORY AUTOMATION

# Mitsubishi Electric 3D Simulator MELSOFT Gemini

# Manufacturing with Visible "Results Before Launch.

Amidst the digital transformation trend, a demand has emerged to speed up the process from product planning to commercialization, however there are hurdles to this, such as an increase in the labor time required for rework and on-site adjustment due to problems during equipment development and upon launch of lines, and delays in decision-making as it is difficult to visualize the effects of investment.

Mitsubishi Electric dramatically improves this problem with a 3D simulator that can verify line equipment in a digital space. Before launching, we can make "results" visible.

## What is a 3D Simulator?

Pre-verification is performed in the digital space of a virtual factory or equipment line. This significantly reduces cost and time during the design phase.

# Achieved reduction of work period by front-loading

# Conventional design phase and work period

# 3D Simulator has a variety of different usages.

# **Usages of 3D Simulator MELSOFT Gemini**

## Line layout verification

#### Build & verify layouts from the eCatalog

Layouts can be built and verified by simply dragging and dropping the necessary parts for line verification from the library and performing easy settings.

# Visualize & analyze using a chart/statistics function

Simulation results can be visualized and analyzed to identify bottlenecks and changes in operating ratio.

**Productive line set up and verification** is made easy through arranging models from an abundant eCatalog and utilizing a statistical analysis function

# Utilization Method

## **Machine Specification Verification**

Operations can be set up by importing 3DCAD data, setting up the mechanism, then using the script in MELSOFT Gemini. This makes it possible to create and simulate machine operations even if ladders and other programming are incomplete. This streamlines the task of alignment conventionally using 2D drawings and timing charts.

"Significant reduction of labor time for rework" is possible by sharing machine operations and reducing miscommunication between designers

## Control program verification

Direct connection to various simulators and FA equipment made by Mitsubishi Electric improves the accuracy of mechanical collision checks. Through connection to other companies' equipment and simulators via an OPC Server, control logic verification is possible regardless of the equipment or machine.

"Reduced on-site adjustment time" by improving the level of control logic completeness beforehand

# Utilization **4 Problem verification**

Status at time of error is reproduced as a 3D model based on log data.

Swifter troubleshooting is possible by combining ladder monitor display, waveform display, and image data display.

Equipment operations can be reproduced in. MELSOFT Gemini based on log data and troubleshooting can be performed remotely, thereby making early shop floor recovery possible

#### Communication support

When proposing machines and systems developed in-house to customers, by showing them how products work on 3D Simulator, information can be shared without misunderstanding.

#### "Smooth mutual understanding and speedy business talks" are possible by showing how products work in various forms (3D, VR, animation)

#### Support for Trial Calculation of Investment Cost for Equipment/Workers

When installing new production equipment or expanding existing lines, verification via simulation of multiple patterns makes it possible to grasp the necessary number of robots, processing machines and AGVs, as well as the necessary number of workers, thus enabling the trial calculation of optimal investment cost.

3 robots and 4 workers are perfect! So the investment cost is XXX and profit is XXX.

**Optimal investment is possible!** by trial calculating investment cost required for equipment and workers based on simulation results

# Line Simulation Edition

## Constructed a system to increase production and reduced cycle time from **128 minutes per unit to 92 minutes per unit!** (actual operation)

The system enables the construction of a line by placing 3D models from an extensive library of approximately 3,000 types of conveyors, robots, AGVs, personnel, etc., to perform optimal layout verification prior to actual line construction or modification.

In addition, the system can visualize the operating ratio for each process and piece of equipment in graph form, making it easy to identify areas for improvement during line modification and to compare the effects of each improvement measure.

## Utilizing the line simulation function to easily perform pre-verification

## Phase 1 Planning

Introduction

example

1)

Formulate improvement plans related to equipment, operator movement, etc.

## Phase 2 Preparation

Reproduce current line based on line/work specifications

## Phase 3 Verification

Verify effects of reproduced improvement proposal

Phase 4 **Operation** 

Apply to actual factory lines for operation

# lssue

The current production line could not keep up with the increase in demand, so there was an urgent need to increase production capacity. The customer urgently needed to increase its production capacity therefore considered adding a manual work station however wants to verify the line change in advance and build a system to increase production without any need for rework.

## Example: Assembly line of Nagoya Works, Mitsubishi Electric

 Work station/5 locations (5 operators)
 Overhead crane/3 units
 Welding robot/2 units

 Current
 Unit production:
 69 units/months
 Cycle time:
 128 min/unit

 Target
 Unit production:
 80 units/months
 Cycle time:
 103 min/unit

# **Utilization flow**

## Phase 1 Planning

We wanted to increase the number of work stations from the current five to six and achieve a cycle time of 103 minutes/unit. However, it was difficult to conduct preliminary verification, including detailed loss analysis, and using conventional Excel-based calculations.

Manual work station Crane 🛛 Welding robot ← Product flow

Phase 2 **Preparation**  MELSOFT Gemini was used to reproduce the current line based on line specifications (station layout, individual work time, etc.)

Current model construction was completed in around two days due to the abundance of 3D models already set up in the eCatalog.

Cycle time was reduced to 99 min/unit with one additional work station and one additional operator. A graph function detected idling losses that were previously unnoticeable, and the installation of an intermediate work station eliminated these losses. In actual operation, cycle time was reduced to 92 min/unit, thus increasing production capacity.

Phase 4 **Operation**  Based on the simulation results of MELSOFT Gemini, the target production volume of 80 unites/month was achieved. In addition, idling loss was eliminated by installing an intermediate work-in-process stand which saved approx. JPY600.000 annually.

Due to the high accuracy of the preliminary verification, rework was reduced by redesign and additional work.

# **Benefits of introduction**

01 02

# Able to verify improvement using multiple patterns Simulations can easily be adjusted, therefore multiple improvement patterns can be swiftly verified.

# Easy to review due to visualization of improvements

Observe process waste in 3D, utilize screen recording, operating ratio chart, etc. during simulations.

## Prevent time loss due to rework

If the production line is actually modified based on Excel trial calculation values, there is a possibility that a study into the improvement method will need to be repeated.

Less labor time

Verifies worker flow lines and line layouts of the assembly line in advance. As a result, we were able to establish a system to increase production without rework!

# **Equipment Simulation Edition**

# Realizing front-loading in a digital space to reduce overall construction time from 40 to 34 weeks!

Reduction of 6 weeks

Control logic can be verified in 3D operation by connecting to engineering tools such as programmable controllers and robots, as well as Mitsubishi Electric FA equipment.

By identifying problems in advance, such as mechanical collision and robot motion during control execution, the system greatly reduces on-site engineering labor time.

# Direct connection to FA equipment and various tools for smooth collaboration

Verification items 1

Control program debugging

# Verification items 2

Teaching + collision check

## Verification items 3

Program verification for cycle time reduction

## Issue

Introduction

example

Delays in upstream mechanical design put pressure on the overall process schedule and did not allow enough time for debugging using actual equipment for downstream control design, which required a lot of on-site adjustment time.

# We want to perform equipment simulation in advance to achieve front loading!

# **Utilization flow**

Teaching +

work and faithfully simulate actual robot

collision check

MELSOFT Gemini is used to perform teaching

operations such as paths and range of motion. This means that teaching and collision check can be completed in advance without actual

2

### Control program debugging

Operations of the control program can be visually confirmed with a 3D model, and defects that were difficult to notice only in the program can be identified. Debugging of control programs without the use of actual equipment is now possible.

machine

#### Program verification for cycle time reduction

Carrier transfer is performed in parallel with robot operation, preventing operation loss. Because wasteful movements were identified and improved at the design stage, the cycle time was reduced by 30 seconds, from 1 minute and 20 seconds to 50 seconds.

**Cycle time** 

# **Benefits of introduction**

## Reduced on-site engineering labor time

Because verification is possible with a 3D model, less time is required for debugging and on-site engineering.

## Enables accurate and rapid collision check

Linkage with RT ToolBox3 prevents equipment damage due to collision and reduces on-site adjustment and start-up time.

### Reduces cycle time before going to the production shop floor Because wasteful movements were identified and improved at the design stage, cycle time was reduced before going to the production shop floor.

#### Cost-effectiveness(e.g.)

Introduction cost	Build period	Introduction benefit	Payback period
MELSOFT Gemini • License cost • Training cost • Labor cost for development upon utilization	Reduced by approx. 6 weeks *If the daily SI cost is 80,000 yen, the cost reduction is 2.4 million yen for a 6-week x 5-day operation.	6-weeks' worth of production profit by reducing start-up time *If daily production profit is 1.6 million yen, profit increase is 48 million yen for 6 weeks x 5 working days.	Approx. 5 days *Assuming an introduction cost of approximately 10 million yen, a cost reduction of 2.4 million yen due to a reduced build period, and an introduction benefit of 1.6 million yen per day.

Validate machine operation in virtual space and improve the validity of control logic before setting up in the field.

Achieve shorter set-up time by frontloading development

Mitsubishi Electric's product lineup, from various controllers and drives to energy-saving devices and processing machines, all help you to automate your world. They are underpinned by software, innovative data monitoring, and modelling systems supported by advanced industrial networking and Edgecross IT/OT connectivity. Together with a worldwide partner ecosystem, Mitsubishi Electric factory automation (FA) has everything to make IoT and Digital Manufacturing a reality.

With a complete portfolio and comprehensive capabilities that combine synergies with diverse business units, Mitsubishi Electric provides a one-stop approach to how companies can tackle the shift to clean energy and energy conservation, carbon neutrality and sustainability, which are now a universal requirement of factories, buildings, and social infrastructure.

We at Mitsubishi Electric FA are your solution partners waiting to work with you as you take a step toward the realization of sustainable manufacturing and society through the application of automation. Let's automate the world together!
